I'm not familiar with the model but here are a few ideas to consider:

1) press enter after you enter the new frequency
or
2) is there a program button on the radio? If so press it first then
your new frequency and then enter

Lori & Robert Metz wrote:

If you do sell it on eBay, don't even HINT about it's coverage ability, or it
will be pulled immediately. Don't post date codes or say anything "cute"
("receives you-know-what", "if you know radios, you know what this scanner can
do", etc.) eBay has really cracked down on this lately, and they WILL pull the
item if there is ANY indication that it even MIGHT be modified to cover the
cellular band.

Message-ID: <B552A40C.2070%apscott@dallasnews.com>
Source record: 87805

Well, E-Bay killed my auction for my ICOM IC-R1 Communications Receiver due to their policy of not reselling scanners that receive 800mhz, even though they sold 5 of the same model in the previous month.

SO.....

I'm auctioning it at my website.

http://www.apscott.com/icr1

This is the ultra compact scanner receiver with complete frequency coverage from 100kHz-1300MHz UNBLOCKED.

Thanks for your continued interest.

Great review, Rich.
I didn't take into account that I was in the U.S. at Dayton, meaning that
if it was available and I had purchased one then, I assume it would be
missing some bands, so I think I'll wait 'til it hits the streets of Canada
before grabbing one. Aside from being a pain to try to remember all the
functions without bringing the "revised" manual everywhere, what can you
foresee as the most exotic functions an avid experimenter would feel in
heaven with on this unit? I'm not sure if I should assume you presently have
the Japanese version in your possession for evaluation, but if so, is it in
any way restricted or does it boast true continuous coverage and all modes,
plus some (answer at your own risk)?

Has anyone seen the display for this radio yet? Is it also like the
Pro-92? Have they improved that weak, almost useless backlight? I
hope they thought seriously about the things that turned the 92 from a
real scanner into a cute little toy.

If it is the same as the 92, then yes. I could in fact envision them
using the same display in the 2067. Gee, I hope they make the
backlight a little more powerful!

That sounds OK (does that mean it won't have talk group lists?) Do you
know whether the guts of the 2067 are the same (i.e., the same circuit
cards put into the new mobile case), or, like the 8600 and the 8200,
does the 2067 have improved RF performance?

>> when it will be available

So, then, has Glenn offered to loan you one for a review? :-)
This could be interesting if the 2067 works really well. Could kinda
cool the enthusiasm for the 780XLT? Or not... We'll see I guess :-)

Hello Bill:

I have an absolutely mint PRO2006 I was going to post. unadulterated can recieve just about everything. It's been used very little. Guess i'm not much of a scanner head. Interested? maybe we can work out something. These thing are like hens teeth lately all being grabbed for military listeners and celllular heads. Don't need the supply if we are talking.

73 es thanks

Tony K2YPT

Hi,

Are there any mods for the Realistic PRO2021 and/or PRO2002 ??
In example : frequency range 900+..., other mods are welcome also.
Thanx in advance,

Rene.

Yeah, I don't plan to buy one unless and until after a number of folks
have tested this thing thoroughly, And now that I found the picture of
the unit (http://www.strongsignals.net/htm/pro-2067.htm - thanks
again, Rich), and I see that it doesn't have a "tuning" knob (and that
it may use the same poorly backlit display, and that it still has
holes in the frequency coverage), I'd probably have to wait until it
went on sale (and had proven to be a good radio) to buy the 2067.

For Sale: AOR 2002 25-1300 Mhz. Scanning Receiver

These are really nice, well constructed, radios. They actually have a tuning knob in addition to all of the features of a modern scanner. The unit is unblocked and covers 25-550 Mhz. and 800-1300 Mhz. This unit is as new, in the box. For specifications and more information please see:

http://www.materials.com/AOR2002.htm

The asking price is $295.

If you're looking for other neat radio and electronic goodies check out the RadioEsoterica Website at: http://www.RadioEsoterica.com

Thanks!

John

Jeff,
I agree with you about the coverage, esp. mil-air, but do you really want a tuning knob on a mobile radio? That seems like a useless feature when driving down the road. The display size also looks pretty useless for mobile use, also.

I don't plan to use it in the car (very often). Given some recent info
from Rich Wells regarding the market for mobiles, I suspect that I
will not be alone in using it as a "base" radio.

But you're right - a tuning knob while driving isn't too useful (of
course I can tune while I'm dialing my cell phone and eating my
lunch)... :-) (oh, of course, I'm parked while doing all this)...

Cross-posted to: rec.radio.scanner,alt.radio.scanner.uk,aus.radio.scanner,phl.scanner

I need to know how to program an old Uniden (Radio Shack) BC-140
Scanner. I can enter a frequency by pressing "ch#" "manual" "the
freq" and "review" to check. But the channel returns to the old
frequency when any other key is pressed.
Any help here would be appreciated.
Thanks
Robert

3264. Re: FS PRO 2026 WITH CELL COVERAGE

Newsgroup: rec.radio.scanner

Just as an aside, the PRO-2026 is one of only a few hobby scanners which can search the Cellular band in the proper 30KHz increments. The others being the 2006, Pro 43. Of course, there are more advanced receivers out there which do this also.

3265. FS: BC200xlt

Last try on selling this on the newsgroups.....Ebay is next and I know it will sell for more than I'm asking on there. I just won't be able to tell its unblocked.

BC200XLT - 200 channel hand held scanner No block on 800mhz. Comes with a leather case rubber duck and charger. Battery is in good condition. Radio is a 9.5 on a scale of 1 to 10.

Lower price. $130 shipped in the USA (priority mail).

I will be listing it on eBay Friday afternoon if not sold here.

You will also have to change some parts in the low-band
circuit so it will tune 30-54mHz also. If you don't, you might
not hear much. Post yer .jpg in the binary scanner group.

It will be identical to the PRO-92 less some "idiosyncracies"
which kept the PRO-92 from being all it could be on trunking
systems! ;-)

> when it will be available

Expect Scanners Unlimited to have a small shipment within
the next week and to be in RadioShack stores physically
not long after. I would imagine the ordering from the
800 number or the RS web site will get you one quicker
than waiting for it in stores.

I am looking for a "general purpose" wide band mast mounted antenna for use with my AOR 8000 and (UNIDEN 780XLT to follow soon). I have limited space available (townhouse) so I would only be able to put up one antenna. I was thinking Discone or Double Discone with an N connector and 50' - 75' 9913 coax cable run. I was also saw ad for NIL-JON antenna that looked interesting. Does anyone have any experience with these antennas? Should I just stick with a Discone with a center element? Any particular brand of Discone better than the rest?

By the way my listening is mostly Civilian Aero / Local PD/FIRE in 800 - 900Mhz / and a little SW and I am in S. Florida.

OK, I'll go along with that. I'm thinking "mobile" as I'm considering upgrading my PRO-2026 and figure I might as well get a multi-trunking scanner even though there is little trunking in my area except the Okla. Highway Patrol. Alpha tags would also come in handy while mobile as I hate to have to look up all the freqs I seldom hear just to figure out who's talking. And then I'll offer the 2026 to the cellular nuts that keep looking for mods. I
imagine I can recoup a large part of the cost of a new scanner this way. ;<)

Is the antenna to be mounted indoors or outdoors?

I have both ... in an attic. Actually, there are three Diamond discones up there.

If you're planning on using the 780 scanner for 800 MHz., I wouldn't suggest the discone as a first choice. I have not used the Nil-Jon for 800 MHz.

The Nil-Jon antenna performs well on high band and UHF. It does appear to have some directional characteristcs, although that might be interaction with other antennas in the attic. The largest element is 7 feet (?), so it won't go anywhere, and it will have some wind load (if mounted outside).

The VR -500 is a high performance miniature communications receiver. It has 1.000 channels and covers from 100 kHz to 1300 mHz. It has selectable modes - CW, AM, USB, LSB, Narrow FM, and Wide FM. Also has selectable steps sizes and VFO.

Coverage includes AM and FM broadcast bands, military air band, shortwave bands, UHF and VHF TV bands, commercial air band, and commercial and public safety bands. Each channel can be tagged with an up to eight carrier alpha tag that is visible while scanning. Uses 2 AA batteries.

The radio is in excellent shape. Comes in original box, manual, antenna, ear strap, and software plus interface cable that allows you upload frequencies and alpha tags from your computer to the radio. Software works great, it a snap to program frequencies into the radio.

For Sale: $300 includes shipping Priority Mail.

Or trade for Sony SW 77, 2010, Grundig Sat 700, or tabletop SW radio.

Something that just occurred to me is that the 2067 will be a poor mobile scanner unless you never drive at night. With no backlit keypad, trying to fumble with the controls in the dark will not be very fun. Remember the 760XLT? It had a few backlit keys, but the number pad was not. Now imagine twice as many keys and none of them backlit. The 780 is looking better all the time. I'm sure the 2067 would make a fine base scanner.

Also, the LCD backlight on the pro-92 is not part of the display itself. Two surface mount "lights" (maybe LED, I couldn't tell) sit behind the display. So, in theory, with more current available, they can spec a higher wattage lamp to improve the backlight.

If you mean alerting others to a scam artist, you are very correct. As a police officer, I am expected to do just that, I am also expected to take some sort of action when a crime is committed. I realize you don't have that responsibility, you probably just turn away when something illegal happens, of course unless it happens to you. Then again, you also probably are one of those who complain about crime being so high and why the police don't do something about it.

Brett,
Sounds good, BUT! This sounds like a GRE-built radio, and they are notorious for lousy display lighting. The edges on either side of the display are (barely) illuminated and the main part of the display remains almost unreadable on every GRE-built radio I've ever used. This may not be true of the 2004/5/6 radios but their handhelds suck. My otherwise excellent PRO-43 requires a flashlight to read in the dark, the lighting is useless. And if this is the same display as the handheld, woops!

3291. South Jersey Communications Site now open

Newsgroup: rec.radio.scanner
Date: 2000-05-26 00:00:00 UTC
From: Joseph Cardani <joseph.cardani@mail.tju.edu>
Message-ID: <8gme4jkrs1@omle.tju.edu>
Source record: 87765
Cross-posted to: alt.radio.scanner,phl.scanner,rec.radio.scanner

The South Jersey Communications site (SJComm) is officially online. SJComm contains the most accurate and up to date public safety communications information (including *trunked* radio system details) for the following Southern New Jersey counties:

Atlantic
Burlington
Camden
Cape May
Cumberland
Gloucester
Ocean
Salem

As well NJ State agencies in South and most of Central NJ.

SJComm supercedes the information in the original South Jersey Scanner Page. It is primarily designed for the public safety professional or volunteer for mutual aid communications. The majority of the information presented is from official state, county and local agency sources as well as contributions from countless public safety professionals, volunteers, and hobbyists. It is also a cumulation of countless hours of monitoring and confirmation.

The SJComm files are accessed via the main page at:

http://users.erols.com/jcardani/sjcomm.html

The files are in PDF format and must be read with Adobe Acrobat Reader. A link to Adobe's download area is on the main page.

You must first join the SJComm list on eGroups (formally Onelist) to have access to the information, since the files are actually housed in the SJComm list's file area. A link to allow you to subscribe to the SJComm list is included on the main page. But *please* read the instructions before you subscribe!

Instructions are included at:

http://users.erols.com/jcardani/sjcomm3.html

As always I am interested in your comments. Also if you have any additions, changes, or questions, please don't hesitate to contact me at jcardani@erols.com

Joe Cardani

Well, hopefully they in fact _do_ improve the backlight. I have a
2042, and with that radio the problem is that the backlight is TOO
bright!!! And there is no switch or knob to turn it down. It's
actually too bright at night...

We can only hope that they fixed the backlight...

3295. Realistic PRO-37 mods?

Newsgroup: rec.radio.scanner
Date: 2000-05-26 00:00:00 UTC
From: JustMyOpinion@webtv.net
Message-ID: <22319-392EE8CA-27@storefull-124.iap.bryant.webtv.net>
Source record: 87769

Hello group.

I have an older Realistic PRO-37 Hyperscan scanner that has the capability to scan up in the 900MHz range, but when you try to program a specific frequency (like cell phones) it will not let you. What it does is back down the frequency your trying to program in by 50MHz. Can anyone help me with how to do this modification, or at least point me to a website that might show how? I've looked everywhere to no avail.

Thanks in advance.

3296. Irvine, CA / Police Frequency?

Newsgroup: rec.radio.scanner

3300. Remote control software for Uniden

Newsgroup: rec.radio.scanner
Date: 2000-05-26 00:00:00 UTC
From: Jeff Seale <jbseale@iglou.com>
Message-ID: <392f4386_1@news.iglou.com>
Source record: 87774

Anybody know of any remote control software alternatives to ScanStar for the Uniden 895XLT? ScanStar is nice, but it's just too darn expensive. I'm also wondering if anybody will invent a USB-type remote control cable, serial is about to go the way of the dinosaur and plug-and-play rules!

3301. Distortion and low volume

Newsgroup: rec.radio.scanner
Date: 2000-05-26 00:00:00 UTC

Cross-posted to: rec.radio.scanner,alt.radio.scanner

For many months, I've owned a Sony Wavehawk scanner. It has been a nice radio, but very difficult to program without the computer. There doesn't seem to be much common sense to the setup of the keys and programming to me.

Anyway, I'm curious as to any suggestions on eliminating a distortion that has devoloped. It exits whether I use an external speaker or not. Also, are there any tips on getting a little more volume to come from this scanner?

Thank you in advance for any useful advice.

3302. FS: Discone, and Super Discone Antennas

Newsgroup: rec.radio.scanner
Date: 2000-05-26 00:00:00 UTC
From: antenna_warehouse@my-deja.com
Message-ID: <8gkhlb$5u5$1@nnrp1.deja.com>
Source record: 87837

Hello,

I have both VHF/UHF Discone, and HF/VHF/UHF Super Discone antennas up
on eBay Dutch auctions.

The VHF/UHF Discone are great wide band receive antennas, and are good
for Transmitting in the Amateur 144, 220, 440, 900, and
1290 MHz. bands with a SWR of 1.5 to 1 or less. They are $29.95

This Auction ends 5/28 9:10 pm cst.

The listing is at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=338768446

The Super Discone has additional tunable elements that give this
antenna greatly enhanced performance in the 25-29 MHz. and the
45-50 MHz. bands. They are $49.95

This auction ends 5/28 9:17 pm cst

The listing is at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=338777872

These are being sold in a Dutch auction, which means no worries about
being outbid at the last moment, or the price sky rocketing
because of bidding wars. You bid, you pay, you get one! If you don't
want to go the eBay route, no problem! Just contact me direct.

Be sure to check our other auctions and website for other great deals
on Scanner, CB, and Amateur antennas.

Thank you

Source record: 87839

I have a like new pro-2004 for sale, everything is open on this baby! it covers 25MHz up to 1,300MHz, very fast scan rate, extremely sensitive, very selective, and of course it does'nt hurt that its considered to be "the ultimate scanner" by world re-known Bill Cheeks, famous for his modification hand books. This scanner has very little use and everything works perfectly, on a 1-10 scale its an easy 9+ (in my opinion only a brand new peice is a 10) If anyone is interested in buying it, im selling it for $350.00 which I think is fair, I see them on e-bay consistently selling at these prices. I have the original manual, a complete parts list to go with it, a bnc type antenna, and a new lithium cell 9 volt battery (for its memory) I will also require additional shipping costs(its up to you if you want insurance) thanks for looking at this post, and please get in touch with me via my e-mail, which i read daily, Best Regards, Frank Joo.

I have some very useful equiptment for sale, that can drastically enhance your "covert" scanning sessions. They are as follows; (1)-Brand new Ramsey Speech Descrambler, its great for de-scrambling ssb(single sideband) and for cordless phones that use speech inversion methods of scrambling, works like a charm and its new, (it does need a 12 volt d.c. power source) (wal wart type is perfect) the selling price for this item is $50.00 plus shipping....(2) I also have 2 Realistic DSP units, (Digital Signal Proscessing units) perfect for filtering out un-wanted noise, its great for C.B. use AND for scanning, there are 3 selectable bandwidths to choose from...Narrow,Med,Wide, the filtering is also selectable 3 ways... NR (just a non specific noise reduction) ssb for single sideband, and cw for morse code, these DSP units are extremely effective and are a very costly option on ALL amatuer receivers, I have 2 of them for sale, the only thing needed are a wall wart type 12 volt d.c. power source, I will let these units go for $35.00 each plus shipping, if anyone is serious about buying any of these fine items, please send all your inquries to my e-mail address, @ jj475171@aol.com and thanks for looking at my post, Regards from Frank Joo.

If your only going to be tracking Motorola, the Pro-91 is a great buy. I've
had
one since they came out, well worth the money. If you need to track EDACS,
the Pro-94 is wondeful radio. I've had my 94 for about a month now and
absolutely
love it.

Hi all,

More spam from me about my scanner up for auction on ebay. This is a great little programmable scanner that covers the usual - 30-54, 138-174, and 380-512. Scan, delay, backlight, lockout, and a keylock. Ideal for a beginner or for an "extra" scanner to keep an eye on a few local freqs.

This auction closes today, so I thought I'd let everyone know one last time! Right now it's at $12.50, so it's still quite a bargain!

Actually, you should only search from 118 to 136 Mhz in AM mode with
a 25 khz step. The 108 to 118 portion of the VHF aircraft band is for
navigation aids and you won't here any voice traffic in this range.

You should also have a look at the AirNav site:

http://www.airnav.com

You can look up the frequencies all Aiports in your area.

Jack Ricci wrote:

That is a very good one but actually because we must store evidence in a "secured" area if it cannot be logged into the evidence room quickly as per state and federal statue. And as is the "norm", the evidence custodian is not around at 3:00am when you make a pinch. But I do like the lawyer reason much better!

That's valid for USAF and USN/USMC aircraft. Army aircraft tend to favor VHF-Low FM for some reason.

FreeTracker V3.0 shareware has been resurrected after being dormant for almost three years because the author was too busy working and dropped out of sight.
It still appears to have the odd bug in it, (after revising it from V2.4), which users would be expected to find and point out so that it can be perfected.
I found it by using the super mega search engine http://www.gohip.com and searched for the word Freetracker. It does take practice to get used to, but it's V Channel function allows you to turn your BC 895 XLT into a 25000+ memory channel scanner!

Anyone have a Schematic for the old (1980) Bearcar BC220 Scanner?

I have a nice one and it funtions perfectly with the exception of not receiving anything. Programs, scans, stops when squelch is turned open, but never receives anything. I have two other bearcats sitting next to it, both doing their thing just fine. Hmm... Tried several antennas and nothing appears to be "mechanically" (connections, solder-joints, etc.) wrong inside.

Any suggestions? Anyone with a schematic or know where I can get one?

email me please giessinger@home.com

Thanks,

Stephen

Greetings,
I have a VX-1R with firmware version A105. It has the mars/cap mod done. It is a 9.5 out of 10 only because it isn't new. I have the box, charger, strap, antenna, and manual.

I have used it 4 times since I got it. I have contemplated selling it. I know that this firmware version is in high demand as it can be moded to receive cellular supposedly.

Make me an offer I can't refuse and I might just accept it. I accept us postal orders or paypal as payment.

Franz in Tahoe

Very near mint condition with telescopic antenna and user manual.
I bought it when I needed more than the 16 channels I got from my old
Bearcat, but now I'm moving from a major city to a small rural town and
this is overkill (good thing I kept the Bearcat). I think someone else
could use it to its full capacity.
They seem to be going for over $50-70 on eBay plus $8-12 shipping, so
I'll ask $50 plus $5 shipping, or best offer.

Regards,
William Schaffner (PopeJohnXII@webtv.net)

I posted the following to this group last year and it was subsequently
published in the April Monitoring Times.

Palm Pilot Frequency Database

Just wanted to pass along a neat idea for anyone out there with a Palm
Pilot. It is relatively easy to create a frequency database and put it on
the Palm for reference wherever you go.
First you need to get the Mobile DB Light program and install it on the
Palm. This allows you to view, sort, filter and find records on databases
for the Palm. You also need to get a free converter program and install it
on your PC. This will allow you to take a HTML or comma separated variable
file and convert it to a format that the Palm will understand. You can get
these files at www.mobilegeneration.com.
I uploaded frequencies from my AR8000 scanner using ARC for Window. Then I
pasted them into a spreadsheet. I used Works, but others will work too. This
was a little awkward since I had to do it one bank at a time. You could also
just type them in instead of uploading them (I'm sure we all have a bunch of
paper scraps with frequencies....). But in the end, I had a big spreadsheet
of all the frequencies, channel, bank, text, and comments that I added to
the spreadsheet. Then I just saved the file as a comma separated variable
file (.csv extension). Then I ran the Mobile DB converter program that
opens the .csv file. I think you can also directly import HTML files, but I
didn't play with that. You also got to play around with the adjustments for
the column widths to get it to look right on the Palm. The converter has a
window where you can edit the data. Then you convert the file and save it as
a file for the Palm. This file then gets hotsynced to the Palm.
All together this took a couple hours - but would probably be quicker the
next time around. I think my next attempt will be to grab the FCC database
for all transmitters in my county and create a database of that on the Palm

Don't tell anyone about modifications if it's going to the regular
U.S.ebay. Someone will complain about the illegality of the unit and get
your ad pulled! I'm not sure if the same thing will happen on ebay Canada
now that they're in full swing. Cellular monitoring is not illegal in Canada
as long as we don't repeat or use what we hear. It seems someone on these
news groups is having fun screwing up " modified scanner " sales!

That's not necessarily true. Yes, 108 to 118 is for navaids. However,
some navaids carry voice - usually the output of a flight service
station that is too far away for you to hear its transmitter directly.

roxx (hpblavatsky@hotmail.com) wrote:
: For many months, I've owned a Sony Wavehawk scanner. It has been a nice
: radio, but very difficult to program without the computer. There doesn't
: seem to be much common sense to the setup of the keys and programming to
: me.

Actually, the unit programing is NOT half as off as it seems at first...it
IS different though.
I have the non-PC version, so I had to learn.

One problem I've noticed, is the unit seems to have a lousy "front
end"..it overloads on strong signals, and ends up "desensed"-you don't
know that anything is wrong, but you end up missing calls.

: Anyway, I'm curious as to any suggestions on eliminating a distortion
: that has devoloped. It exits whether I use an external speaker or not.

I doubt that you can do much about the internal speaker volume, but the
earphone jack has a resistor in line with it..try this...put a speaker
into the jack, then put a low value(5-10 ohm) resistor between the sleeve
side of the plug and the outside of the BNC connector...you'll hear the
volume go up.
A ohmmeter between the two jacks shows about 47 ohms-probably the value of
the internal resistor.
If the internal speaker is 8 ohms, then opening the scanner up and jumping
the resistor out will cause no problem..if the internal speaker is higher,
like say, 32 ohms, then then take that value, and subtract the value of
the external speaker(probably 8 ohms), and replace the internal resistor
with that value(in this case, 24 ohms).
BTW, before someone starts posting the difference between DC ohms and
AC impedance, yes there is a difference, but not enough to matter in this
case.

: Also, are there any tips on getting a little more volume to come from
: this scanner?

See above.

: Thank you in advance for any useful advice.

BTW, if you DO open your unit up, I'd really like to know the value of the
speaker(in ohme).

3383. Scanner squelch to activate relay???

Newsgroup: rec.radio.scanner
Date: 2000-05-28 00:00:00 UTC
From: Dan Barnawell <awarren233@freewwweb.com>
Message-ID: <N2bY4.5297$VO2.138076@newsread2.prod.itd.earthlink.net>
Source record: 87735

I need some info on using a Realistic pro-2025 16 channel scanner to activate a relay when the squelch is opened..... I want to use the scanner as a receiver on a remote base to key my 6 meter ham radio when the scanner receives a signal on the 440 mhz ham radio band.....Can anyone give me some information on this? I have been unable to find a schematic on the 2025 and I have been told that when the squelch opens there will be voltage come up on a pin inside the scanner..... Any ideas of how I might find that pin when I do not have a schematic? I am also open for any other advice on this subject.....

Thank you,
Dan (N4YSV)

Contact your local/area U.S. Customs office and ask about registering your equipment before you leave. Don't know if they still do this any more, my last experience was 20 years ago. Used to travel to/from Europe 6-8 times a year professionally. I went to the Customs office in Tulsa with all my camera equipment and filled out a form listing make/model/serial number. The Customs agent compared the equipment against the list then signed and stamped it. Customs didn't keep any copies of the form. I carried my copy and showed it to the inspector when reentering the States. Only once did the inspector even bother to start checking my gear against the list, the guy at the next counter told him it was OK, I was a regular, and that was that. Doubt the inspectors will worry about your radio gear as long as you can prove it has already been admitted to the U.S.

In a previous article, "Jason Winters" <jwinter@u.washington.edu> writes:
>I have a bc245 scanner and lost the antenna. Any suggestions for a good
>replacement.
>

I don't know if the BC245 is a handheld or desktop scanner, but an exact replacement from the original manufacturer is usually not necessary.

Almost all handheld scanners us a BNC connector for the antenna. Any scanner antenna with a BNC connector should do fine.

Desktop scanners usually have a whip antenna that screws into the top of the unit in addition to provisions for an external antenna. All that's needed for the whip antenna is to get one aproximately the same length and the same threads to screw into the scanner. Almost all external antennas will use a PL239 connector (often called a UHF connector). Brand will not matter.

All CI-V radios I've worked with have that capability, but, as you
say, come with a default setting. I actually have ICOM's CI-V
protocol manual but would rather not reinvent the wheel if someone
else has already done the work, which is why I'm asking about
existing software. ICOM's software isn't exactly great stuff -- I
have it.

Its funny that you say that Gary, but my boss mention that to me for reason, to raise the price of power. But if you think about it, there is such a heavy use of power these days compare to the 70's. Last year, here in the city there was area blackouts in Manhattan. It was a long 4th Of July weekend and the hottest days was when we were off. I talk about it and my boss felt it was during a work day, there would have been a major blackout. Con Ed the power people said that a heavy drain in the area cause a power vault to over heat and proof. I know for a fact in one area the same thing happen because the business use so much power and Con Ed never updated for the demand. Well I'm prepare as much as one can be. Just hope I'll be at home.

Unless there is a real problem, you might be able to reset the
microprocessor by pulling the inline fuse to the radio and leaving it for
five minutes before reconnecting. That might kill any programmed memory
also......or it might have 0 effect. Worth a try.

With " Free Trade " , we don't even pay tarrifs or duty at the border in Canada, but we do pay 7% GST plus 8% PST (15 % taxes on the Canadian dollar amount after the U.S. value is converted to Canadian currency- they get us coming and going). So don't be afraid to send scanners to Canada-none of them are illegal here! Make sure you send us the entire 800 band.....and don't tell your border police. Ours don't care!

Try searching the web, but search for PocoNo. <G> Also, try the
counties and towns you plan to visit, the Poconos cover a lot of area.
If you're looking for the area around the race track, try Long Pond, PA.

DS <groundzero@earthlink.net> wrote:
>does it just simply boil down to a price issue? Or a name-brand issue-
>say Motorola vs Kenwood vs 'generic brand'? Or a feature issue?

It is to some extent a feature issue. Some of the very cheap ones
don't have all 14 frequencies; others don't have CTCSS. Other
features which may be absent are an adjustable squelch and scan.
Battery life may also vary. The Kenwoods provide some half-assed sort
of scrambling, as well, but I don't know the details.

However, it is largely a brand-name recognition issue as well; in my
opinion the $100 radios are nowhere near four times as good as the $25
ones.

I'm just curious: is it legal in your state to have a scanner in a vehicle?

Here is Minnesota, it is illegal without an amateur radio license or permit. Fortunately, I am a ham! I'm just wondering if it's legal in California/Arizona. You might want to check that out if you don't have a license/permit.

Just a note Sports Authority is selling the Cobra FRS-310W for $69.95 and
you get a $20.00 rebate from Cobra for a total price of $49.95. Not bad,
this
is a pretty neat FRS with good audio, weather proofing and weather alerts.

I am selling my AOR 3000A. It has been well looked after and works flawlessly. Coverage is 100Khz - 2036Mhz with no breaks. Yes, it will receive cellular. I am not going to bore you with specs... but if you want them then here is a link:
http://www.strongsignals.net/htm/ar3000a.htm

You get:
AOR 3000A Communications Receiver
110V A.C. Adaptor
220V A.C. Adaptor
Antenna
Instruction Manual
Original Box & Packaging

See for yourself - click on this link
http://personal.globalnetisp.net/kab/images/aor3000a.jpg

I am open to realistic offers. I am located in Vermont; USA.

3417. 80 Channel mod for BC60XLT-1 Scanner

Newsgroup: rec.radio.scanner
Date: 2000-05-29 00:00:00 UTC
From: Jack O <foresterNOSPAM@ecsis.net>
Message-ID: <qfd6jss2lum7f0shc7hf60orrh84g34fa7@4ax.com>
Source record: 87619
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I recently came across a simple mod for the Uniden BC60XLT-1 that increases the channel capacity from 30 to 80. Here's how it works:

1. Remove the battery cover and batteries.
2. Remove the four screws that hold the back cover of the radio on.
3. Remove the back cover. The upper part of the cover has some nubs that hold it to the front cover, so you will have to pry a little to get it loose.
4. Remove the main circuit board from the radio by lifting it up from the bottom to unhook the multiple pin connector on the lower right, and unsnapping the upper part of the board (this may take some gentle prying too).
5. Remove the four screws holding the metal shield to the logic board, then remove the shield by lifting the lower part to "unhinge" the upper part.
6. Locate the large (maybe 1/2" square) microprocessor in the center of the board. To the lower left of the board is a "1" printed on the board. Below the "1" are two oval shaped solder pads. Bridge the pads with a drop of solder, and you have 80 channels.

As far as I can tell, everything works fine. The new channels appear in numeric order, and can be locked out or set to the priority channel just like the original 30 channels.

The BC60XLT-1 still steps through the channels rather slowly, so this may discourage filling all of the channels unless you keep some locked out. It makes the radio much better for scanning at NASCAR races, since many more channels can be assigned to a car number (too bad about the 88, 94, and 99 cars).

Jack

Source record: 87620

I looked at those Motorola units, and the Kenwood ones, too. I settled on the ICOM IC-4008A's, for a few reasons:

The Motorola units look cool, but the push-to-talk button is on the front, not the side, which seemed like a pretty bad idea to me. I've never had to push the button in the middle like that while talking; seems unnatural.

Secondly, the ICOM units also check once a minute for other ICOM units nearby on your channel (and your CTCSS tone, if you have it turned on), giving you an audible confirmation (just a squelch break) and a constant visual status; I use this constantly. I also didn't see this feature on other comparable units.

Thirdly, the Motorola antennas stick up all the time; looks kinda cool, but not very practical. My ICOM's rotate down and out of the way.

Fourth, if you make use of the CTCSS tones, you can "ring" others on your freq+CTCSS in any of several choice rings.

I personally felt like the Motorola units were much more mass-market oriented, same or higher price for less functionality.

Source record: 87665
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Greetings, all...

I'm hoping someone has an answer to this... Is there any software
out there already written that is designed to operate more than one
ICOM CI-V compatible receiver from a SINGLE serial line -- using the
CT-17 hub to communicate to them?

I have an application where I'll have several ICOMs all working
together from the same computer and would like the following
modes of control:

o Independent
o Master/Slave or Slave/Slave (computer control)
o Bandscope on one centered on other's tuning frequency

Anyone know if such a beast exists?

Thanks much!

Eric

Oh, ignore horse-fucker. Barry O'grady is a long-time troll
who takes pleasure in dispensing useless or even destructive
advice. He periodically shows up here with a new name (surprise)
and I <*Plonk!*> him as soon as possible. To my knowledge
he has never ever dispensed useful advice -- just misinfo.
My "favorite" -- if you can call it that -- was an answer to
someone who wanted "the mod" and would have destroyed their
radio on his advice.

In summary, ignore horse-fucker. There are very good people
on this group and you learn who to ignore and who to listen
to and who to ask questions of.

BTW, you are right; AMPS is alive and well in the U.S. Lots
of analogue floating around out there.

7700-7854 Off Turnpike Fire
8100-8999 Authorized Service (Tow)
Special PA State Police

Police & Maint/Work Crews use same channels on.
PSP Troop T handles patrols on the turnpike. ALL Troop T dispatch
is done from Harrisburg. System is linked via microwave.

Pennsylvania Attorney General's Office

154.950 (F-1) -Drug Enforcement Mobile-to Mobile
155.445R/XXX.XXX (F-2) -Drug Enforcement Dispatch
155.490 (F-3) -Drug Enforcement Regional (CLEAN)
156.090 (F-4) -Drug Enforcement Special Operations
460.200/465.200 179.9 Department of Justice North Repeaters (F1)
460.475/465.475 179.9 Department of Justice South Repeaters (F2)

From: "Darren North" <northd@cvn.net>
Here is the channel plan for one of the PA Office of the Attorney =
General portables. Two of these channels have been posted before, but I =
think the others are new:

Channel Tx / Rx PL Tone
Ch. 1 465.475/460.475 179.9
Ch. 2 460.475/460.475 179.9
Ch. 3 465.200/460.200 186.2
Ch. 4 460.200/460.200 186.2
Ch. 5 465.200/460.200 179.9
Ch. 6 465.475/460.475 186.2

Use depends on if one of the channels has been assigned to local agencies.
Western PA is primarily 460.475
From R.E.Christian (wpascanrec@geocities.com)

Pennsylvania State Police Liquor Control Board Detail>

158.7600R/156.0150 151.4 F-1 (Phone Patch Capable)
158.7600R/156.0150 123.0 F-2 (No Phone Patch)
453.1375R/458.1375 Harrisburg
45.3000 Simplex Portables (Old System)
From R.E.Christian (wpascanrec@geocities.com)

Pennsylvania Emergency Management Agency (PEMA)

PEMA uses 5 channels:
453.525/458.525 Main Repeater
453.350/458.350 Mobile Repeater

453.525 Simplex
453.350 Simplex
158.835 VHF
45.300 (Old System)
PEMA uses DIFFERING CTCSS (PL) tones for various counties main
repeater as follows:

Allegheny Co. 210.7
Armstrong Co. 103.5
Carbon Co. 136.5
Clearfield Co. 179.9
Fayette Co. 118.8
Indiana Co. 136.5
Lawrence Co. 156.7
Washington Co. 156.7
Schuylkill Co. 210.7 rpt. tx 179.9 Input
Somerset Co. 136.5

PL is NOT used on 453.350 the mobile repeater or simplex.

169.425 PEMA Rain Gauges
169.500 PEMA Rain Gauges
169.525 PEMA Rain Gauges
170.275 PEMA Rain Gauges
171.025 PEMA Rain Gauges
171.085 PEMA Rain Gauges
171.125 PEMA Rain Gauges
171.850 PEMA Rain Gauges
171.875 PEMA Rain Gauges
412.625 PEMA Rain Gauges

Rain Gauges are scattered throughout the state, and transmit
data on the above
frequency back to the local EMA office. At that point it's
collected on a
computer using IFLOWS software, and relayed to PEMA HQ in HBG via
Ku band VSAT
satellite system.

PEMA also utilizes the Ku band satellite system known as SEVAN
to send
messages to local EMA offices regarding events around the state,
and weather
information from the NOAA Weather Wire.

SEVAN also provides for a voice channel to all EMA agencies,
and a video
channel from PEMA HQ.

DEP offices include 6 Regional Offices (Conshohockrn, Wilkes-Barre, Harrisburg, Williamsport, Pittsburgh, and Meadville) numerous satellite District Offices, and several Mining Offices (Pottsville, Hawk Run, Knox, Ebensburg, Greensburg, McMurray). Each of these office has a base radio that can utilize different combinations of the above repeaters or primary channels. For instance, Conshohocken uses 151.385 (103.5) for primary communications and also utilizes any of the Zone 1 repeaters that cover the service area of that office. A map showing the coverage areas of each of the Regional DEP offices can be found at http://www.dep.state.pa.us. DEP offices in Conshohocken, Reading, Harrisburg, and Pittsburgh also use 151.160 (186.2) for Radiation Protection. These 4 offices can operate via a microwave link over this channel for nuclear disaster drills/operations.

PA. DEPARTMENT OF ENIRONMENTAL PROTECTION (DEP)
OFFICE
Region 1 Southeast (Conshohocker)
151.385 103.5 Primary
151.160 103.5 Secondary
151.160 186.2 Radiation Protection
Region 2 Northeast (Wilkes-Barre)
151.385 103.5 Primary
151.175 156.7
151.385 88.5
151.175 114.8
Region 3 Southcentral (Harrisburg)
151.385 103.5 Primary
151.295 114.8 Secondary
151.160 186.2 Radiation Protection

Region 4 Northcentral (Williamsport)
151.295 114.8
151.175 156.7
151.175 114.8
Region 5 Southwest (Pittsburgh)
151.385 127.3 Primary
151.160 127.3 Secondary
151.160 186.2 Radiation Protection
Region 6 Northwest (Meadville)
151.400 103.5 Primary

DEP mobile units identify usingtheir program addreviation or Mining office name:
AQ - Air Quality
BF - Black Fly Sppression Biologist
ER - Emergency Response
WM - Waste Management
WQ - Water Quality
Pottsville xxx, Hawk Run xxx, etc - personnel based in a Mining Office
others may vary by office

Unit ER 11 would be the Emergency Response Chief for the Southeast (Conshohocken) Region of DEP. The first number designates the region, the numbers following that are unique to a person or position.

Also State Parks and some Fish Comm. units use DEP & DCNR Freqs.

Regional Land Mgmt\Food and Cover Corps personnel are deoted with an ID of
65x for the SE region.
Units with a 60x ID are management and unassigned officers (floaters).
Any of the above numbers followed by an alpha character denotes a deputy
of the area officer.

Statewide IDs:
Wildlife Mgmt personnel use 5x and 6x ID's (i.e. 5, 55, 60).
Land Mgmt. personnel use 7x, 7xx and 80x ID's
Education uses 9x Id's and Foresters use 8x & 8xx Id's
There are a few other ID's in use, but they shouldn't be frequently
encountered.

Found this article in another NG.
It may be interesting to radio enthusiasts.
Scanner users may want to program the
frequencies of their local utility into their
radios for future live listening !

--------- begin quoted article ---------------

High-energy nation could pull the plug on the power grid

By LISA HOFFMAN
Scripps Howard News Service
May 29, 2000

- You grab a few cubes from the ice-maker for your iced tea, nuke a frozen pizza in the microwave, toss a load of wash in the dryer, notch up the AC, crank the stereo, scan in a couple of photos to e-mail to relatives, and sit back for an evening cruising the Internet.

Upstairs, the kids are styling their hair, playing computer games and listening to the radio, while your spouse is in the basement office finishing the spreadsheet work that didn't get done that day on the job.

That seemingly serene summer scenario is anything but that for those in charge of supplying electricity to the nation.

Energy experts warn that the onset of the hot season, coupled with the recent acceleration in the wiring of America, is likely to bring months of power brownout and blackout alerts in unprecedented number.

As demand drains supply, the cost of power for companies and consumers is headed for a dramatic uptick. Peak-time prices hundreds of times higher than usual are forecast this summer in some regions.

Why? Combine a sizzling economy, an explosion of computer users at home and on the job, and a proliferation of other electronic devices ruled by microprocessors for work and play. The result is a ravenous appetite for reliable electricity that must travel over a lagging transmission system designed for a largely bygone era.

"The system, designed as a two-lane road, is now being used as an autobahn or New Jersey Turnpike," said James Owen, spokesman for the Edison Electric Institute, an interest group of private electric companies.

Particularly worried is the burgeoning high-tech industry, as well as firms engaged in Internet commerce or otherwise dependent on e-mail and similar online ways of doing business.

For them, a blackout, or complete power failure, can be ruinous. From online stock trading outfits to such Internet merchants as eBay and Amazon.com, every minute the power is out can mean millions of dollars lost.

Brownouts _ caused by intentional cutbacks in electrical juice _ also can wreak havoc on sensitive equipment, including that used by everything from ATM machines to auto mechanics. Surges or other blips, even those imperceptible to an office worker, can knock a microprocessor for a loop.

The digital world, according to experts, demands a power supply that is essentially 99.9999 percent steady and reliable. Despite its stresses, the U.S. system is remarkably dependable, but even so, the average residential customer can count on glitches causing a cumulative seven or eight hours without power a year.

That would be catastrophic for new economy enterprises, where a disruption as brief as "one-60th of one second is enough to make everything go blooey," said Karl Stahlkopf, vice president of the non-profit Electric Power Research Institute in Palo Alto, Calif.

Estimates are that the economy will lose more than $25 billion a year as a result of power disruptions which, until the digital age, were far from rare but hardly so crippling.

In the past decade alone, the power "load," or demand, has increased 35 percent while the capacity to get that electricity to users has grown only 18 percent. Conservative forecasts predict another 20 percent boost in demand ahead, but no more than a 4 percent hike in transmission capacity. A big part of the problem is that no one wants new power poles or stations near their homes or businesses.

Complicating the situation is the ongoing deregulation of the power industry.

"The country is increasingly sensitive to any type of disruption," said Jamie Wimberly, vice president of the Consumer Energy Council, a watchdog group in Washington.

Already this summer, the Silicon Valley region of California, broiling now in a heat wave, is being warned by Pacific Gas & Electric to make a concerted conservation effort or face significant power problems and financial penalties. Energy experts expect the same situation to bedevil other parts of the country this summer, particularly in other high-tech hubs.

Some technology firms are shelling out big bucks to build their own power plants to insulate themselves from disruptions. In Redwood Shores, Calif., for instance, computer hardware and software giant Oracle Corp. has spent $6 million to construct its own generators and substation system.

The Energy Department and conservation groups have begun to amplify their calls for the country to cut back consumption through more energy-efficient appliances and power-stingy habits.

Some in the industry are demanding more financial incentives to stimulate investment in the nation's power grid, coupled with fewer restrictions from the Federal Energy Regulatory Commission.

"We have to build a type of electrical power infrastructure that will support a microprocessor-based society," Stahlkopf said. "We have very little choice."

3436. FS:Icom 7100,full coverage!

> Mark

Hi Mark,I know he sounds extreme,but what if what he was saying contained
even a grain of truth?
Scott Barker in the"community Development" thread said:I absolutely agree
with you on most of the points you raised and consider
them vital to the future of communities. The state role in community
development has been historically one of domination and control....

I wonder because on some level I think people are aware of the tremendous
influence of advertising,people are aware of the power some people have and
seek it for themselves,people are aware that the government is full of
paupers and child abuse,drugs and escape are epidemics.

We can blame it on microwaves ,or we can really look deep and go
beyond"conspiracy" and toss out the temptation to get easy answers.
I know if a government had a way to exert faceless control as needed on the
most pesky nosy types that would not risk court or looking like a criminal,
for P.R.alone,they'd do it.
Child abuse happens at home and it's very common made
culturally'invisible'under the guise of a innocuous idea of' for their own
good' abusers use that silences people who are abused as kids,Abuse so often
is made untouchable by outside forces by happening in sacred space in our
culture "The Family"unit..If a family is not safe for it's own kids or
spouses ..why keep it secret or sacred? It is known kids die being placed
back in abusive homes,because social workers are overworked and burnt out
and under budget with a huge caseload.A 1 % tax on the top 5% of the
rich,funds could do wonders eliminating child abuse Ex-Surgeon
General,C.Everett Coop was fired over those numbers getting public as well
as other things..

Why should our government be considered such a sacred space too,with a
legitimacy battle going on between a paid off and lazy press more interested
in filling up space between high paying ads,,or socially rejected and pooh
poohed but tireless 'underground'watchdog system of 'outcasts' and
'freaks',after all the press and government allegedly it's "for the
people",so why keep secrets from the people and why sell the media to the
highest bidder and their stupid salesmen P.R. concerns?

Did you know if the government, just increased taxes on the top 5% by 1 % we'd have millions of dollars added to our'budget' for education,health care etc and solve a lot of our' 'domestic'problems'?It isn't as "tight" as the government wants people to believe.It's just the wealthy don't give as shit about the communities they parasite from and who's gonna MAKE them give a shit?Anarchist teens protesting with a Starbucks coffee in their hand funded by mommies and daddies money??????Sheesh..

In the FBI, people burn documents 24 hours a day .The incinerator people" trained" NOT to read what they are tossing to burn.They are trained NOT to think, it may be dangerous for the people.
So what they toss in the incinerator is lost information,no one but officials know,so "we the people" have no idea what truths or lies is resigned to ashes as if it never existed.It could be things we would choose not to participate in,it could be things that could make us sick .

The Government has the"tank" an unbuggable room in the Pentagon ,and no one in the public or even some of the government knows what is discussed there.But we all assume it's 'nice' agendas or'safety'because we DON'T know if it is or isn't.We like to tell ourselves the government cares,yet it ships our men to war because leaders have tempertantrums when they can't subjugate another nation...The Pentagon is a pigsty(60 minutes tour) with tunnels leading who knows where,but they felt ok in the 80's charging 5,000 dollars for a toilet seat..yet raw sewage drips on peon workers desks..asbestos hangs in sheets out of the ceiling,and chemicals leach in the groundwater there.yet the Defense Budget is how much? What in the hell are they blowing that money on? A satellite mind control system for every citizen ?!!? Sheesh,either way it's not like they'd tell US,"The people" that paid for it..

Clinton recently passed a bill on Mind Control,and a release of information clause...The Info...it hasn't been forthcoming.Why? Why is it like this?

We have nuclear weapons and someone is so detached from his own humanity that he will follow orders given even if it kills him and destroy life as we know it,for his God&Country's agendas and tempertantrums.If you look deeper than the surface it looks sicker and sicker.Check out project Censored It's a group of reputable journalists disgusted with our "system"..
This guy may not be a total nut,he just might be very hurt.

My understanding of ICOM CIV is that the protocol states the radio address(ie. model) in the string. All radios wth the same address will work in parallel. Each radio model is assigned a specific address by ICOM and in my reference notes it states that some radios can alter their address through jumpers.

Therefore, an ICOM R71 will ignore commands sent to an Icom R7000. Two ICOM R71's off the same hub with the same address will work identically and simultaneously.

The trick would be to somehow alter the address of one or more of the radios within the radio to make it think that it is another type. Careful, as some control programs may allow/disallow certain commands based on the radio type. No matter how hard you try, you cannot set the frequency of an R71 to 144.500 even if the radio has its jumpers set to be an R7000. Commercial control programs probobly use the standard addresses issued by ICOM without any ability to override them.

This is all just a guess as I don't have any CIV ICOM radios anymore, but at least it gives you some possible pitfalls to be aware of.

I thought I was the only one who notice this story. It was on ABC news and try to look up the story. But it mentions New England and New York State as a problem area. Oh great thats where I live and remember the blackout of 77. Well I have tons of y2k stuff to keep me going. But on a more serious point, I live in the city and been noticing and I'm not the only one that there has been a lot of surges in the city. Some surges have been very bad to have shut down my computer and had to reset the office equiptment.

Sometimes prerecorded landing and takeoff information is prerecorded (Airport Terminal Information Service (ATIS) and transmitted on a navigation aid frequency. It can also be on a comm freq.
You normally would hear something like "O'Hare Airport Information Bravo)then the weather, wind, altimeter, approach in use, landing and departing runways and any other pertinent information).

Rosetta Laboratories recently introduced a newer version of their WiNRADiO-1500 series. They now have a 1550 series, which they claim has better performance. I'd be interested in hearing any comments, both good, and bad, regarding the 1550 series.

Also, is there any WiNRADiO users that have tried the new Trunking Software?

Thanks,
Bill Crocker

Sometimes, you get an interesting call.. othertimes, it's routine stuff.... I have heard illegal drug deals... Golly if I were to arrange such a thing, I'd do itfrom a pay phone.... Cellular Phones are radios and transmit radio signals.....If I want a private conversation, I do it from a land line.

Friday nights can be interesting if you are near a restaurant or bar.... I work nights in a data center and often take the scanner with me to work... ON Friday nights, we have fun listening to either the drunks on hte phone or people argueing.... some are kinda funny.....

Then of course, on the regular trunked systems, you have the probation people wanting to know why someone was not at community service, work, or whatever.... you also have people calling their wives, and construction crews placing supply orders.

you don't even have to cut a CB antanna... I find a CB antenna works fine as is.....
the CHP (California Highway Patrol) use 39 and 42 mhz frequencies..... I have no problem with just a regular CB antanna

Bob Camp wrote:

Ther are several different aircraft frequencies tha can easily be
monitored....depending on where you are

go to http://www.airnav.com then enter a city or airport code and get a
list of active frequencies

VOR This is a navigation al beacon but some broadcast weather info
Clearance Delivery (validates flight plans at busy airports)
Ground (Ground control directs plans on the taxi ways and ramp areas)
Tower... Issues takeoff and landing clearances, also coordinates helicopter
traffic
Departure and approach Handle aircraft arriving and departing up to about
30 miles out
Center Handles enroute traffic. Centers use remote radio and radar sites you
can hear them for miles
centers also work high altitude traffic.. you may be able to hear justthe
plane side or both.

Flight service stations.. they provide weather, flight plans, and take pilot
weather rep[orts

Company frequencies... Airlines company networks.. here crews report
mechanical problems,
get weather information, or request supplies.

There are also Police and Media aircraft as well as military aircraft to
monitor

3452. CHP and I-10

Newsgroup: rec.radio.scanner
Date: 2000-05-29 00:00:00 UTC
From: JA Moran <john@analon.com>
Message-ID: <3932A24E.C81BBE12@analon.com>
Source record: 87690
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I travel frequently on I-10 between Phoenix and the Glendale/Burbank area and also to sites around Los Angeles and Orange, and Ventura counties.

I usually have two scanners with me..... With one, I let it search 39.0-43.0 This will usually find an active CHP frequency rather quickly. I let the other scan the police, medical, and sheriff frequencies

42.44 was the Indio dispatch frequency (Colorado River West to about Beaumont) But I also
have noticed activity on 39.88 and other 39mhz frequencies.

On the Arizona side, it's 460.40. This repeater is somewhere in Quartzsite

I believe the CHP has a repeater on that Butte just west of the Blythe Airport.

On some nights, I don't see many Arizona or CHP units, but on others, I see several.

I think both CHP and Arizona Highway Patrol use aircraft to spot disabled cars in the middle of the desert as well as to track speeds. A few years ago, I blew a tire on I-10 near Corn Springs Road, and a CHP aircraft flew over. They were trying to ask me something over their PA.. could not hear them so I dialed the dispatcher on my mobile phone.... they wanted to be sure I was ok.....

I eventually got towed to Blythe and got a new tire. If you can help it, make it to Blythe or anyplace else on your own... towing is expensive in those remote areas.

I like the AOR-8000 or the AOR-1000 both are great radios and receive with NO GAPS....
to get better reception, it helps to use a high gain antenna designed for the frequency range you wnat to listen to.

both of the above hav 1000 channels! the AOR-8000 goes from 0.5mhz up to 1900mhz

and th AOR-1000 from 0.5mhz up to 1300mhz... you can even listen to TV audio on either of these.

Recently reported in the newspaper:

Good Samaritan Hospital in Phoenix is under contract with several US and
Foreign airlines to provide in flight emergency medical advice.

The Flight crew makes contact either via a company frequency
(128.0-132.0mhz), or via an ARINC operated HF frequency.

The Doctors at the hospital assess the information provided by the flight
crew, offed advice and try and determine if it's ok for the flight to
continue to it's destination, or if an unscheduled landing is necessary.

>instance have been less. As I recall, even the Kenwood is only 300mw. So
>for maximum distance, check and make sure the specs show 500mw.

A great FRS reference site is over at:

http://members.tripod.com/~jwilkers/frspage.html

Check out the user reviews.

fyi the older UBZ-LF14 Kenwood's are 300mW while the newer Freetalk LH are
500mW; my experience with the LF's are that they get as much range as any
other FRS radios I've had/used - as others can point out also. The only
down side to the LF's is lack of (easy) channel scanning and awkward
programming sequence. Other than that, I just picked up another pair from
Fry's at $40 each - definitely the BEST deal around!
I routinely get 2++ miles out in the open (as in really, really open fields)
imo the M-brand FRS radios are overpriced with a funky (toyish?) look... a
FR50 unit died out on
me after a 3' drop onto a pavement -(

But I digress; it's a scanner ng - btw, how was FRS trafic over a scanner in
your area over the Memorial weekend?

I have three units I bought on uBid for $15 each. They are Jensen
branded and have full scan, CTCSS, and all legal freqs. When I mountain
bike with my friends one cannot tell the difference between my radios
and the others, some of which were over $100 a pop.

LUCKILY, this problem is one for California, the upper Midwest and the
Northeast. Least affected is the Southeast US, including our little
South Carolina, the nations Nuclear Waste Dump. Our nukie generators
supply way, way too much power for South Carolinians to use....so much
so we're powering about 6 states!

I worked 2 1/2 years at PJM (Power Grid for the Mid-Atlantic States). I would say the most of the trouble will come from internal politics than anything else. That place is too worried about "Perception" and "Appearance" than it is about its customers. After seeing how your power is delivered and the type of people who make these decisions I a)Bought my own generator and b)Started my own Business as it was a sickening place to work.

Then the real joke was Y2K testing...people I feel we got damn lucky. I know for a fact that software I was told to test was not tested the way it should have been. I was never given the hardware needed to preform the required tests. However I was told to sign off on it anyway simply because it all needed to be test by a certain date. Many software sub-systems were never tested.

Next, the unfair treatment of the workers....If you were a woman you had it made! One woman in our department would come in at 9AM, (should have been there at 7:30), work til noon, take 2 hour lunches several times a week and leave at 5 on most days. However NOTHING was ever said, NOTHING was ever done. and the manager left it go while condeming others for leaving a few minutes early. Then there was a time we were all trying to get some new software installed and working. We had a deadline to meet. Three guys were working our nuts off trying to get it working in time however the "woman" said "sorry, I can't help test anymore as I'm going with friends to Atlantic City tonight" and left..... Guess what nothing done, nothing said and the manager know about it.....

I'm just glad I don't work there anymore!

George

Heath GR-1132 xtal scanner with all 3 bands and telescopic antennas for each band. Lots of chrome and polish. $50

This one is in real nice shape and has the original manual.

It was the FIRST user programmable scanner that used the scan buttons as dipswitches to program
using codes from the manual.

16 blinking lights are great to watch and you can lockout any channel using the switches.

It was the first scanner to do away with crystals.

Very collectable.

$150 or take a good regular scanner in trade or trade in as this one should be just sitting in a collectors
shelf.

Evereything works fine on it with no problems or burned out lights, loose switches or any other
problem.

[One or more binary attachments are retained only in the source text.]

Power output on FRS radios has very little to do with range. This has
been tested extensively by folks on the FRS groups and lists.

Also have Micro Digital Lite on the 800-900 cellular band which means
that you get to make calls without dropping out and from longer
distances unlike PCS.. I bought it new a couple of years ago.

It comes with 2 leather belt cases.

2 overnight drop-in chargers and 1 Intellicharger fast desk charger

Motorola Micro Tac Lite phone thrown into this package. Works but is
not in service right
now. Give it to your wife as all cellphones work on 911 by law whether
in service or not.

7 BRAND NEW in package slim Nickle Metal Hydride batteries

2 BRAND NEW Nickle hi-cap batteries

3 used for a year still work good hi-cap batteries

5 used but still good slim batteries

All batteries are Motorola, not some off brand

$200 or trade for whatever you offer-maybe

I will split this package up if you only want some of the things.

I am selling this to get a Star Tac instead. It is in good shape and
looks good.

By the way, there is a National Serial Number List that the cell
services all look at before they activate any phone. If you bought a
"good deal" at a flea market of from the "guy in the alley" you can kiss

your money goodbye. I bought my phones new so I know it is a safe one.

The annoying pulsing is probably from when the radio is looking back at the priority channel which may be the selected radio channel. Depending on what is your operational requirement you would probably want the selected radio channel your priority channel when the scan feature is activated so you don't miss any radio traffic. The RSS can rearrange your scan configuration.

What's the year, make, and model of the vehicle? In many cases you
can get help from the manufacturer on reducing RFI from the vehicle.
Many of today's cars and trucks have some annoying interference from
the ignition system computers, fuel pumps, and other electronic noise
makers.

It would also help if you could describe the "static" and if it
corresponds with anything such as engine speed, whether it's present
before the engine is turning over, and other useful tidbits of
information.

Joe "hides behind alias" Blow. You messed up again! It was posted in aus.radio.scanner.
Note the aus. part. I realise you are too busy scanning news groups for excuses to post off topic, but you have missed the fact that the analogue network has closed down.
Why oh why do you want to make a fool of yourself?
You should stick to playing with yourself and terrorising the users on your local UHF CB repeater. The kids and dogs you should leave alone.
Say, just as a radical experiment, have you considered posting on topic? It won't hurt a bit, and you may even make some friends. If you don't understand, ask someone.
Also, if you are being sexually abused you really should tell someone, rather than taking it out on innocent readers.

There are people who can help you.

The Radio Shack 2045 is a great mil-air scanner. For handhelds I'd say
the Yupiteru MVT-7100 is tops, along with its big brother, the MVT-9000.
For less money the Radio Shack Pro-60 is a good choice.

Next weekend, June 3 & 4 is the Scott AFB airshow.
This will be the first airshow at the base in several years and it's unfortunate, but the aerial firepower that's scheduled to fly is a major disappointment. Despite it all, I'm going on Saturday and will do what I normally do on Sunday's by crossing the river into St. Louis and watching airplanes at STL all day.

If anyone would be interested in hooking up on Saturday, please let me know at the e-mail address
that's listed. I'll also be FRS & CB transmit capable and will be monitoring FRS Channel 1 (462.5625) & CB Channel 40 (27.405).

USAF Global HF System Site Schedules

GHFS is (primarily) an Air Force network providing command control
support to the US DOD & NATO, & support on a non-interference basis to other
US government agencies and friendly foreign governments. It is primarily
an air/ground system, with occasional maritime and ground-based users.

All freq are Upper Side Band (USB). The 10780kHz channel isn't technically
part of GHFS, but it is listed along with GHFS assets.

GHFS Ground Stations
ANDERSON = Anderson AFB, Guam
ANDREWS = Andrews AFB, MD
ASCENSION = Ascension Island Aux AB (N Centr S Atlantic Ocean)
BAYONNE = Mil Tfc Mgmt Cmd Emerg Comms Ctr, Bayonne NJ
CROUGHTON = Croughton AB, England, UK
DIEGO GARCIA =
ELMENDORF = Elmendorf AFB, AK
HICKAM = Hickam AFB, HI
INCIRLIK = Incirlik AB, Turkey
LAJES = Lajes AB, Azores
McCLELLAN = McClellan AFB, CA
OFFUTT = Offutt AFB, NE
SALINAS = Puerto Rico
THULE = Thule AB, Greenland
YAKOTA = Yakota AB, Japan

Many of the aircraft heard on GHFS channels use the static, tactical
callsign "REACH" followed by numbers and/or letters.
"REACH" is the static, tactical callsign issued by the USAF Air
Mobility Command for aircraft on AMC missions. If you just hear
"REACH ######" the aircraft is most likely using its tailcode. If "REACH"
is followed by letters & numbers, then the aircraft is usually using their
mission #. This is most often done for missions requiring diplomatic
clearance.

None that I know of. However if you build a scanner for a TV IF, it's
a no-brainer to put a Cable TV tuner in front of it.

3492. Kewl WinScan trick

Newsgroup: rec.radio.scanner
Date: 2000-05-30 00:00:00 UTC
From: Jeff Seale <jbseale@iglou.com>
Message-ID: <393417f4_1@news.iglou.com>
Source record: 87530

This trick involves WinScan's WFF file format (this is the format your channel lists and trunk scanlists are stored in). If you open a WFF file in Note Pad or any other text file editor, you'll notice that the WFF format is actually a comma-separated values file or CSV for short, which can be viewed in virtually any spreadsheet program. By making a copy of your working WFF file and converting it to a CSV, you can keep a database of your favorite channels and GIDs. Give it a try.

Mark are you telling us that CORPORATE AMERIKA lied to the American
public? Are you telling us that BIG OIL put their own interests before
those of "our" country? Next you will be claiming that the U.S.
Congress, and even the President himself (gasp!), lie to the citizenry
and put their personal and corporate interest (but that is reduntant)
before that of the American public! Please say it ain't so!!!

3494. Q: Best base scanner these days?

Newsgroup: rec.radio.scanner
Date: 2000-05-30 00:00:00 UTC
From: MD <medic@bigfot.com>
Message-ID: <TnVY4.744$yb4.25903@newsread1.prod.itd.earthlink.net>
Source record: 87532

Hi folks,

What's the best scanner for base use with an external elevated antenna? I live in a city with a lot of paging and other noise, so good rejection is a must. I had an R7000 ten+ years ago. Is *that* still the best base unit?

Thanks!

MD

The Learning Kingdom's Cool Fact of the Day for May 30, 2000

Brought to you by: The Academy http://academy.LearningKingdom.com

Serious interactive learning from The Learning Kingdom -- FREE.
The Academy is for all ages. From arithmetic for kids to
geography for adults, we have something for everyone.

Enrollment (takes two minutes):
http://academy.LearningKingdom.com/newstudent.html

How does the Global Positioning System work?

One of the wonders of the modern world is that a handheld electronic instrument can tell you exactly where you are on the planet, including your altitude. This is the Global Positioning System (GPS), which uses a fleet of 24 satellites carrying extremely accurate clocks to aid navigation worldwide.

When a GPS receiver is activated, it listens on radio frequencies for signals from the GPS satellites. These signals contain precise information about each satellite's location in space, along with the exact time when that information was sent out.

When the receiver has time and location information from four different satellites, it uses its own computer to figure out where you are. By taking into account how long each signal took to travel at the speed of light and exactly when it arrived, the GPS unit can determine where you are.

A GPS primer for students:
http://www.aero.org/publications/GPSPRIMER/Intro.html

Atomic clocks make GPS possible:
http://www4.nas.edu/beyond/beyonddiscovery.nsf/web/gps

what do you mean with reference?
if you want my comment about icr10 - i have one, and i am absolutely
content with it. itï¿½s one of the best scanners available.
there are two or three better hand scanners, but they are more
expensive.
if you want to hear more , contact me,
Matthias

No problem with a scanner in car in Calif, and I don't think there is a problem in AZ.

Towing costs: if the CHP calls a tow for you, it can be very expensive. If you call your own tow, it can be a LOT cheaper. Or use AAA. Or maybe your insurance will cover roadside tows..

Tom

Hello,

I have a RS Pro 90 and I love it. I use it to listen to our local FD and PD. They are using a Motorla II trunking system. I got the freqs from trunktracker.com. I also use it to listen to our local air ports. IMHO it's a great radio.

Hopefully that scam artist and others will not profit from a blackout. But my fear is looters and so call anarchist who are waiting for this to happen. Also those who will try to profit and will to jack up prices for most needed items.

Lock and load is something I'm not ready, but if it does happen, then the @#$% has really hit the fan.

Glenn Miller's favorite side man Tex Beneke (K0HWY) Died this
morning peacefully in his sleep. He played Tenor Sax in the 1940
civilian band of Glenn's and sang many songs with the orchestra. He
appeared in both of Glenn Miller's films, "Sun Valley Serenade"
(1941) and "Orchestra Wives" (1942)

He will be always remember for his vocals on "Chattanooga Choo Choo",
and "I've Got a Gal in Kalamazoo" the former of which became our
Nation's first gold record ever awarded in 1942 by RCA Victor / Bluebird
Records.

When Glenn went in the Army, Tex was drafted into the Navy. After Major
Glenn Miller's
death in 1944 and the AAF Band disbanded in 1945 it was Tex who was
asked by
Helen Miller to form a new Glenn Miller Orchestra, from 1945 - 1950.
His Band was probably the best of all the official Glenn Miller bands.
A truly sad loss to all Glenn Miller Fans everywhere he was 87 years
old.
He was also an avid model railroader.

3512. squelch tail?

Newsgroup: rec.radio.scanner
Date: 2000-05-30 00:00:00 UTC
From: Jerry Williams <jwilliam@xmission.com>
Message-ID: <3934907E.A1936304@xmission.com>
Source record: 87550

I have a Pro 51 and it as a really bad squelch tail. I have been
looking at the Pro 92 and
it seems to have no squelch tail at all. But I read a review and it
said that it has a hiss.
So I need to go back to the store and listen for the hiss to see if it
is something that I can
live with. My question is what scanners are there at about the same
price range $100-$250, (maybe a $100 more if it is really good) and has
very little squelch tail, handheld or desktop. I like to listen with
headphones and don't like to have to turn it
up to hear and then get blasted by the squelch tail.
Thanks for your help!
Jerry

Source record: 87623

I need to purchase a pair of FRS radios and am overwhelmed by the the HUGE (mostly $$$) differences. Yeah, they all claim "2 mile range" so does it just simply boil down to a price issue? Or a name-brand issue- say Motorola vs Kenwood vs 'generic brand'? Or a feature issue?

Maybe someone out there knows the scoop- for instance.... do all the different 'manufacturers' really get their radio's guts (electronics) from one source? Does Motorola make any 'generic' brand radios?

I'm leaning towards a Motorola 250, but if anyone has a suggestion.......

3518. Re: FRS- the good, bad & ugly?

Wife and I use a pair of Motorola 250s anytime we go somwhere we might
be separated (fleamarkets, etc). Absolutely delighted with them.
Two-mile range is probably point-to-point on a beach (no obstructions).
We have a normal range with houses and trees of about one mile.

There is no difference in distance, etc. but some have CTCSS coding, scanning, etc. so, if all you want is point to point commumications then just about any pair will do. That being the case, go to : www.cyberrebate.com and get their pair for $39.95 after a $60 rebate. They have a 30 day no questions asked return if you just don't like the unit. There are also a lot of other totally free things at that site.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap,rec.radio.scanner
Body handling: Binary attachment payload not displayed: dconti2.vcf

I realize the post may be off topic, and I am really not sure what radio group it is appropriate in, but I was hoping that someone familiar with the Motorola VISAR radios and their programming could answer a question for me...

In my VISAR radio, when I put the radio on scan, and it stops on an active channel, I hear an annoying pulsing in the background. I am assuming that this is some type of Priority Channel system where the radio is searching the priority channel for activity.

I would like to eliminate this function, but not sure how to do it. I assume that it is something to be done in the programming of the radio.

Any input is appreciated, thanks in asdvance.

Dan

Had the same problem a few years back (1995) with my 91 Ford Explorer (combo AM/FM radio/cassette). Took it to a local car audio shop (lived in the Antelope Valley CA at the time) and they had the part in-stock (face plate). Replaced it for $104. Has worked fine ever since.

I can scan the invoice and email it to you if you're interested. Good luck

There can be a difference in distance! Not all FRS radios are utilizing the full 500mw allowed by the FCC. Numerous FRS radios sold by Radio Shack for instance have been less. As I recall, even the Kenwood is only 300mw. So for maximum distance, check and make sure the specs show 500mw.

can you ps tell me way i am making a wrong post to this news group.???
ps i would like to talk to one of the program mangers of the news group......
yesterday 5-28-00 i received a vialition notice, from aol. i made a new post
today
,this afternoon. with the same scanner ,only i changed the wording. 5-29-00

id20000527 234428-08414-00000475 gng-cq1.aol.com.7 date 5-27-00

tonight i was taken off line from aol. i still do not understand what i am
doing
wrong???? even after talking to the aol action team,to night....

so here i am. can some one help me out ??

i have been using this rec.radio.scanner for three yrs. and this is the first
time
i have been told i am not doing the right thing.. is there a change in the
rules??
i also have been posting my ph #. with all the postings i have made.. is this
wrong?? please e-mail me a ph# of some one i can talk to re: this mater..

thankyou. ddubsky@aol.com (denny)......

3538. Re: What is Trunking?

Newsgroup: rec.radio.scanner

In Windsor, Ontario, Canada all the main police force, fire department, transportation, city works people and Casino Windsor transportation are using the city-owned trunking " 800 " band system because as a business corporation, it's more economical for those employed by the city to use the same radio system instead of buying different towers and radios and antennae and frequencies and licenses for different departments.
A good trunking scanner can listen to and identify who in the group you are hearing and also allows you to pick and choose wich departments you want to listen to and ignore the rest.

3540. Freq. For Motorola Radius SP50??

Newsgroup: rec.radio.scanner
Date: 2000-05-31 00:00:00 UTC
From: Doug Fisher <psleprob@hotmail.com>
Message-ID: <39358606.2898AC28@hotmail.com>
Source record: 87446

Can somebody please tell me what would be the best frequency range to search to find the frequency(s) in use by a business that uses Motorola Radius SP50 handheld radios? The antennas are probably six inches long. They are also very thin and flexible. The radio didn't have any frequency labels/listings on it. I have looked up general charts that show the breakdown of frequency allocations but there are a lot of different groupings for "business" and "industry."

Thanks in advance,
Doug

3541. Pro-94 hyper search mode?

From: Scott Amspoker <sda@rt66.com>
Message-ID: <eg1bjs4cou5t0o88mf38hq3lranr9mq11i@4ax.com>
Source record: 87447

I recently got a Pro-94. The manual describes the hyper search feature as searching up to 300 freqs/sec in some bands as opposed to the normal 100 freqs/sec. OK, cool. Why would I not want to always use it? I assume there's a tradeoff or it wouldn't be a user setting.

I have a similar problem with my AOR-1000

This weekend, I disassembled the unit and removed the button mat. I cleaned the circuit board contacts with IPA. I then reassembled the unit..... Not sure if i need a new keypad mat or if I ned a new circuit board. Every button works except the most important one, the SCAN button.... well, it does work but takes a little doing..... I am thinking it's more of a keypad mat problem than a circuit board problem.

AOR does have a Service Center in Torrance California.. I believe they are on Western Avenue
near about Torrance Blvd..... It's in a busines complex and their storefront faces the road.

I had one of my units services thers and they did good work.

I also have a Regency MX-7000... this guy had a similar problem.. I was unable to get replacement parts.. a new keypad.... so I disassembled the unit and then wired a switch grid in the same manner as the keypad was wired..... It doesn't look pretty but it works....

For the handheld, though I would prefer replacing the keypad mat The regency is a Desktop unit and is much bigger than a hand held..... plus it only has a 20 channel memory capacity..... but It has great frequency range... 25mhz-1300mhz with NO GAPS. All my radios (I have 5 scanners) have no gaps

JOHN

3543. Albuquerque police?

Newsgroup: rec.radio.scanner
Date: 2000-05-31 00:00:00 UTC
From: Scott Amspoker <sda@rt66.com>
Message-ID: <ip1bjsclsmn4k4btvchko169vo26njqkrt@4ax.com>
Source record: 87449

I've recently discovered the joys of scanning and have been concentrating mainly on police bands. I got the Police Call guide and found several frequency lists on the 'net. I've programmed anything I could find into my Pro-94 (including several Albuquerque police frequencies).

As far as I can tell, the police for Rio Rancho, Sandavol County, Bernalillo County, and NM State police are all out there working their butts off. Albuquerque police are really quiet. I occasionally hear from them but nothing representational of the size of Albuquerque. I also have the Albuquerque trunk system set up but I'm mainly hearing city maintenance folks on that.

Can somebody clue me in as to where APD is hiding out?

Thanks.

They will probably use the same frequencies ther that are used at other
races....

search 464.0-465.0 for race track parking, security, track control etc

The car driver frequencies will be what are used at other events as will be
the media (ABC, MRN, TBN, ESPN)

AMEN

I can't tell ya how many times I'd loved to pull over a Police, Sheriff, or Highway Patrol for changing lanes without signaling..... or driving fast without lights and siren on.....

the Los Angeles Police has a big scandal unfolding now..... It;s been discoverd that the Judges and prosecutors sent innocent people to jail... people pleaded guilty just to get things over with.....

Prosecutors and judges... what ever happened to checks and balances....

And to top it all off no one knows all the laws, not police, prosecutors, nor judges.
When they break the law their buddies take care of them. And they are worse lawbreakers than those whom they prosecute.

signals are line of sight.... the higher your antenna the better....

If you had a scanner on top of a 40 story building, and another ontop of a house.. the one on the 40 story building would have the greater range.. all other things being equal (the power of the transmitter and location of the transmitting antennas)

> without lights and siren on.....

Hopefully the next time an officer is racing to your house on a "silent run" for a burglar or other problem, he will think about your post and go the other way. Or maybe he/she forgot to turn on those lights and siren while responding to a medical emergency at your house.

> the Los Angeles Police has a big scandal unfolding now..... It;s been
> discoverd that the Judges and prosecutors sent innocent people to jail...
> people pleaded guilty just to get things over with.....

Oh yea, big scandal, a bunch of scumbags voluntarily pled guilty and now have some jailhouse attorney promising to overturn the conviction if they say they were "coerced" into pleading guilty! Some scandal, done in courtrooms across the nation every day. The problem is when they present the scumbag's signed agreements and videotaped statements....then, they should charge every one of them with perjury! How about their defense attorneys that went along with the agreements? I guess it is just one big conspiracy! Big scandel!(sic)

>
> Prosecutors and judges... what ever happened to checks and balances....

Lawyers threw the checks and balances right out the windows!

> And to top it all off no one knows all the laws, not police, prosecutors,
> nor judges.

That is because the lawyers and politicians spend more time changing them around to accommodate themselves so no one can know what is what!

> When they break the law their buddies take care of them. And they are worse
> lawbreakers than those whom they prosecute.

Oh, I see, and you have been prosecuted for every wrong thing you have done in your sorry little life? I'm sure there are NO bad apples in your profession!

3551. Re: Albuquerque police?

APD recently switched to a digital trunked system. When I was there at Thanksgiving they were still simulcasting on the old VHF freqs, I guess they are not doing that anymore. The city service system that you are hearing has been in use for a while. Albuquerque is actually licensed for 3 trunked systems according to Police Call. When I was there last I programmed all 3 in and found one was the still city services, one was used by Albuquerque public safety and one was used by Bernalillo County public safety. I believe that BCSO has access to the APD system but an not certain, I was only there for a few days. If you look at the call signs listed w/ the freqs in Police Call you will see three different ones.

13 minute NPR program in Real Audio about the mysterious "Numbers Stations" on shortwave radio. "Eventually, if listeners dig around long enough, they'll tune across voices reciting endless strings of numbers. These broadcasts have been heard for at least 40 years. The signals are powerful, but they contain no information about location of the transmitter or the intended audience. Most listeners linger for a short time, then tune away, utterly baffled."

Barry "hides behind alias" Satan. You messed up again! It was posted in
aus.radio.scanner.
Note the aus. part. I realise you are too busy scanning news groups for
excuses to post
off topic, but you have missed the fact that the analogue network has
closed down.
Why oh why do you want to make a fool of yourself?
You should stick to playing with yourself and terrorising the Horses on
your local Farms. The kids and dogs you should leave alone.
Say, just as a radical experiment, have you considered posting on topic?
It won't hurt
a bit, and you may even make some friends. If you don't understand, ask
someone.
Also, if you are being sexually abused by a horse you really should tell
someone, rather than
taking it out on innocent readers.

There are people who can help you.

Barry

I would appreciate any comments on using an HT as a scanner for police and fire bands. I have been doing HF for a little over 10 years, but have not until recently gotten interested in VHF or UHF. With the fires here in northern New Mexico lately, I'm getting interested in keeping in touch with other local hams and participating in emergency service. So, in the interest of saving some money, I wonder if an HT with fairly wide range VHF/UHF coverage would be adequate for my needs. I'd rather spend more on a great dual-band HT than on a mediocre HT and a mediocre scanner. I'll be checking with the local fire services to see if they use trunking (which I assume that HTs don't have), but I don't think they do. Many thanks in advance, and all the best from Pecos, NM!

When trunking there is NO squelch tail whatsoever... provided it is set to
disconnect when the control channel sends its disconnect command... You can
also set it to have a squelch tail if you would like :)

In conventional mode it is a very short "chunk"

Sure a wide band HT will work. Yaesu makes some very wide ones but my
Standard an Icom units work fine. Only problem with HTs is that most
emergency services are trunking now and it's doubtful any HTs will
cover 800 mhz. Even if it does, while you can listen in, you can't
follow any trunked QSOs.
Also while many HTs have some memory scanning capabilities, they don't
scan as fast as most dedicated scanners. On the positive side if you're
in a metropolitan area, most HTs have CTCSS tone capabilities which is
rare in hand held scanners except the very expensive ones. But hey, if
you are planning on monitoring one or two untrunked frequencies,the HT
works great.

Sorry! Subject should read AOR - AR1000XLT!

FS: AOR 100XLT Handheld Radio/Scanner.

I have decided to sell or trade this fine radio because I don't use it enough to justify keeping it.

Most of you who have been into SWLing and scanning will know what this is. For those of you who don't, it is a "Wide Range Monitor". It covers 500 KHz through 1300 MHZ contunuously. Modes are AM, FM (narrow) and FM (wide). There are a total of 1000 memories in ten banks of 100 eash. This is a late model unit with a high serial number. It is in excellent condition both electrically and cosmetically. It was always used in its' carrying case. It comes with the original box and documentation, antenna, case, NiCad batteries and 120 Volt charger . Most important I am including Howard Bornstein's essential GUIDE TO THE AR1000. This is an 80 page book that describes in great detail how to use the AR1000 and how to get the most out of it. Finally I am including a special desk stand I made out of Plexiglas that holds the radio in a slightly angled upright position with a special hole drilled through the side of the stand to accomodate the battery charger/power supply.

It should be mentioned that listening to certain frequencies may be illegal in different countries and potential buyers are strongly advised to familiarize themselves with these regulations before purchasing this radio. This radio has no restrictions or "blocked frequency ranges" and so it is the responsibility of the user to comply with the monitoring restrictions in their own particular countries where it will be used.

I will sell this complete package for USD $300.00 plus applicable shipping and insurance charges.

If interested please reply by e-mail. As a reference you may feel free to check my feedback page on eBay (http://www.ebay.com) if you wish. My user id is the same as my e-mail address.

Cross-posted to: rec.radio.swap,rec.radio.scanner

Sorry! Subject should read AOR - AR1000XLT!

FS: AOR 100XLT Handheld Radio/Scanner.

I have decided to sell or trade this fine radio because I don't use it enough to justify keeping it.

Most of you who have been into SWLing and scanning will know what this is. For those of you who don't, it is a "Wide Range Monitor". It covers 500 KHz through 1300 MHZ contunuously. Modes are AM, FM (narrow) and FM (wide). There are a total of 1000 memories in ten banks of 100 eash. This is a late model unit with a high serial number. It is in excellent condition both electrically and cosmetically. It was always used in its' carrying case. It comes with the original box and documentation, antenna, case, NiCad batteries and 120 Volt charger . Most important I am including Howard Bornstein's essential GUIDE TO THE AR1000. This is an 80 page book that describes in great detail how to use the AR1000 and how to get the most out of it. Finally I am including a special desk stand I made out of Plexiglas that holds the radio in a slightly angled upright position with a special hole drilled through the side of the stand to accomodate the battery charger/power supply.

It should be mentioned that listening to certain frequencies may be illegal in different countries and potential buyers are strongly advised to familiarize themselves with these regulations before purchasing this radio. This radio has no restrictions or "blocked frequency ranges" and so it is the responsibility of the user to comply with the monitoring restrictions in their own particular countries where it will be used.

I will sell this complete package for USD $300.00 plus applicable shipping and insurance charges.

If interested please reply by e-mail. As a reference you may feel free to check my feedback page on eBay (http://www.ebay.com) if you wish. My user id is the same as my e-mail address.

For Sale:
AR-8200 UK Version
-Original Packaging
-Manual
-US AC Adaptor
-Cigarette Lighter Adaptor
-Original Unused NiCad Batteries
-NiMH Battery Set
-Hand Strap
-Original Antenna
-Original Short-wave Antenna
-Transparent form-fitting carry case

This unit is used, but it is a 9/10. There are no scratches on the display, or anywhere else. You will think this is new in box. The included case has never been used. This is the UK Version of the AR-8200 that had extra shielding pre-fitted by AOR-UK.

A Picture is available at http://www.mikew.org/AR-8200.jpg

I am asking $530obo, which includes FedEx 2nd Day Insured Shipping anywhere in the continental US. Other locations ship at buyer's expense.

Please respond via E-Mail

nospam@mikew.org _is_ a valid email address.

3579. Re: computer scanning.

I've used the Icom PCR-100, and PCR-1000, as well as the WiNRADiO-1500e, black-box, computer controlled radio/scanners. As for antennas, I've used everything from a rubber ducky, wide-band discone, to a random long-wire. The radios all performed very well. It is important when using a wide-band receiver, to be aware of the antenna requirements. It is impossible to find a one-does-all solution. What's good for 800MHz, will not work at all for short-wave, etc.

LOL...That was funny! :)

> PS, got to run, my covert ops helicopter just landed and I've got to go.
> Need to reprogram the satellites to check for people scanning cellphone
> freqs so they can be conditioned to vote for Gore.
>
> THE ABOVE IS A DIRECT VIOLATION OF NSA DIRECTIVES! YOU WILL FORGET YOU
READ
> THIS!

Well silly as it sounds It is true,the incinerator people at the FBI are trained to forget what they may read as they toss information no one outside the top bass gets to even see,into the flames of forgotten proofs and ideas some may be already done some may be too controversial,some may be bullshit but fact is,nobody knows.And the FBI ain't saying anything....

Sure paranoids got problems and they can be over the top.., I think on the other hand, our culture and the people who create it to feed off of it are the REAL psychotics and there is no'cabal' of 'them' just assholes 'flocking together covering ass and doing the shit assholes dop to make a buck at anyone else's expense....Look at the greedy destruction
(Tell me,what the hell use is it to blow up our world like 50 times and still seek MORE plutonium? 1 time would do ya,right?)

Look at the historical repetitious scatology of self glorified nation leaders,tempertantrums that send young men to die time and time again,for'national interests' whatver those might be,???, and the 'moral' pressure exerted to'stand up and protect the womenfolk and kids from the enemy' routine that never fails to rouse the sleepy deluded masses to grasp for death willingly. If only to create a name for themselves as a national 'hero' an icon among all the hysteria surrounding war.

Wars like Vietnam,were a big scam on the average Joe if I ever saw one. The hippies should have not attacked the soldiers but the government sending them,and the officials tight lippede about thier reasons.

Why are so many politicians on both sides of this artificial Left-Right divide so corrupted self absorbed,distant,and unaccountable to the people, and the public so apathetic about it or misdirected about it.Focusing instead on consenting adult to adult sex affairs? That crap gets more press and therefore legitamacy instead of shady deals or criminal acts being uncovered.The media seems to exist for advertizing,and shows are fluff between ads. Look at the price for coveted superbowl advertizing air time! With fluff we are distracted from uncomfortable questions like why we were in Kosovo to begin with and not other troubled countries..(O-I-L that's

what.)....?

Maybe it's not satilites,maybe it's our own cultivated and encouraged individual feelings of rage,betrayal, hoplessness,feelings of powerlessness, coupled with an unescapeable lifelong extortion by the marketplace to feed producers,,and the chronic so easily believed comforting lies we live out in our culture that's eating away at our individual interpretations of self-responsibility,community obligation, humaness,genuiness ,integrity and sanity?
What do you think?

Gary,
Sure, I use my ADI AT-600 as a dual purpose unit, only real fault as far as I'm concerned is a rather slow scan speed. And several months ago one of the scanner mags, Monitoring Times or Popular Comm., had an article on using a W32A as a scanning receiver. There are trade-offs. Slow scanning speed, no trunking (may or may not be a problem), and the lack of really adequate priority channels. When activity really starts to hop, I go ahead and add a handheld scanner to the mix, earphone in each ear. I used to be a police dispatcher, so I'm used to listening to multiple radios at the same time. The AT-600 can be found as a refurbished unit w/ warranty at the ADI/Premier site for $199. Also get the so-called gift package for $99 which includes a HP NiMH battery, a LP NiCad battery, drop-in fast charger, and auto pwr cord. http://www.adi-radio.com/

Source record: 87588

Trunked systems use several channels and group various departments onto the same radio system. One theory why police and fire dept's went to trunking, is that it would make monitoring more difficult. People wanting to listen to the police and fire services would also have put up with listening to the Garbage Collector and Dog Catcher, and this might deter eavesdropping. Each department cannot hear the other, even though they share the same system. This system operates in the 800 mgz. range.

Hi Clay,

I can highly recommend the Dual Band Telescoping antenna sold by
Smiley Antennas. I have had excellent results with transmitting on 2
Meters and 70 CM, and listening all over the place, while using this
antenna with my Yaesu VX-5R. The antenna is very reasonably priced,
too - I paid around $20.00 for mine at the Dayton Hamvention.

Smiley is online at http://www.htantennas.com

Good Luck!

Maybe your TAX dollars go for their salaries but they do not work
for you. Look at it this way, I work for company X and you buy
company X's product. Does that mean that I work for you? I don't
think so.

Does that also mean that since a cop pays taxes that he is paying
his own salary?

Try taking a chill pill and get a better attitude....

I've been going to the GP in Montreal for many, many years with a scanner. I have found that there is very little chit chat from car to pit or vice versa. The best listening I have found is the television camera crew. These guys are positioned at every corner, know the cars and drivers extremely well, and talk a lot. They will tell you who ran wide, who got loose, who has a good battle going, who is fast, who is slow, who sputtered smoke, who is missing.....well you get the idea. Much more informative than the race track broadcast, and much more informative than the TV broadcast announcers. If you email me privately I'll dig out the freqs from the last couple of years. RG

Yes, actually it does. I"m the customer, you're purpose as a
business is to serve my needs.

But police are not a private corporation. They are a division of
government, and in this Constitutional Republic, Of the People, By
the People and For the People, the government and it's agents work
for me. That includes police. The police are empowered by the
public, and the commission of the force is by ballot. Yes, very
much, as a citizen, the police work for me.

Get the new Alinco DJ-V5T HT. It transmits on both
144 and 440 mHz. Clip one wire on the PC board and you get
5 selectable "banks" with 70-998 mHz coverage.

The Alinco is also on special right now from Grove Enterprises
for just $249.98 + shipping. webpage at www.grove-ent.com/index.html

I am a officer for a city here in Texas. We get a lot of calls that are not priority 1. Most of these, I go the speed limit, but when there is a burglary or a crime where the suspect is still there, I usually arrive without lights and sirens. Just because an officer gets a call, doesn't mean that he/she has to use lights and sirens. That is left up to the officer. Face it, an officer has a lot of discretion. I rarely use mine. The only time I use mine is when I stop someone or go to a high priority call. My friend who is also an officer, was involved in a accident not too long ago. He was driving down the road doing the speed limit. He got a call and turned on his lights and sirens. Just after he did this, he had to make a left hand turn. He told me that he was going at least 50MPH. The limit on the road was 40MPH. As soon as he started to turn, a car with two teenage girls came out and the two vehicles collided. After the accident, the two girls said that the officer was not using his lights and siren. They were not telling the truth. The detectives listened to the dispatch tapes and could clearly hear the siren in the background of this officer's communications. People need to respect the law not disrespect. Being in law enforcement is not easy. If people that are always complaining could walk in a cop's shoes for a day, they would stop griping. This job is very hard and can be very stressing. Now, I know there are officers who need to go back and learn some things or just get out of the force, but just because there is, doesn't mean we are all bad.

FWIW, the City of Irvine was the only OC PD that was licensed on its own at 460 Mhz. All the other cities used the countywide 460 system. At least, that's what I was told while in Irvine. Our radio club (IDEC -- Irvine Disaster Emergency Communications) was supported and trained by the Irvine PD and our repeater shared the radio facilities at the City administrative building.

I made that statement because he was talking about "pulling over" police officers in the course of their duties, also known as Obstruction of Justice and Interfering with a Law Enforcement Officer. I have a very good attitude, three Medals of Valor, a commendation from the Attorney General and a commendation from the Governor in less than 12 months. Others who count must think I am doing a good job.

> Keep sticking your foot in your mouth, Piero. Makes for fun reading. Comic
> relief, if nothing else.

Instead of worrying about my posts, you should go to the law library and study up on your Federal Civil Statues so when YOU make statements about libel, they won't be so incorrect and full of fantasy!

The PRO 92 is worth about $100 as a second scanner. It is a very poor choice as a primary trunktracking scanner. That is why radio shack s dumping it for a redesigned model that fixes some of the Pro 92 problems.

Radio Shack will continue to mark down the current Pro 92 stock until they are all sold. If you really want one you can wait until they drop below $100 in the computer. The disadvantage is that in some areas they may sell out before they reach this price level, but I am betting they will not in GA.

But...

By the time Radio Shack releases the new GRE product, Uniden [in September] while have third generation trunktracker [less than $400] that is light years ahead of GRE in features and total value.

I was curious if there is a "Privacy Code" table for FRS radios that give the CTCSS tone for each? I realize that my Yaesu VX5 is a little more powerful than FRS radios are supposed to be, but I don't want to buy an FRS to communicate with those that have them since I already have a radio that can do such. Does FCC actually monitor FRS use by the people? It seems like it would be too much work to try to locate an offending party unless they are transmitting with major wattage and in a fixed location. As long as I'm not dumb enough to use my ham license on an FRS frequency, it seems like I should get away with it, especially for short occaisional uses.

I am personally against any set speed limit, but I do agree with the
"Basic Speed Law"; don't drive faster than is safe for the conditions.
Posted prima facie speed limits are BULLSH!T. Here in California for
example, I find it quite safe to cruise down Interstate 5 in the San
Joaquin Valley at 90 MPH. Speed, in and of itself is not the danger.
The problem is when you have to deal with IDIOTS that feel they have
to enforce speed laws by getting in front of you and trying to slow
you down. Also, this would not be a safe speed for an inatentive
driver (is there any safe speed for an inatentive driver?) When I
"fly" down I-5 at 85-90+ MPH, I am constantly keeping track of
vehicles seen within the horizon; both in front and behind. My car

handles quite nicely at those speeds and I actually get the best gas mileage at those speeds (I know, one trip I actually tried to stay close to the posted speed limit... made no EXTRA stops and got the worst mileage ever. This was in a '95 Ford Taurus with 3.8L V6. I realize it may vary from car to car.)

Ummm, that is kind of the Lt's job is to listen to what you say and try to make you feel better by saying they will take care of it. In actuality, what most likely happens after that is the Lt jokes with another supervisor about some dumb ass's complaint. A Lt's job is very political and tries to placate the public. He may actually do something about it. They may make an announcement for officers to try to keep their speeds down when not responding with lights and siren. I seriously doubt that a particular officer would be punished for one citizen's complaint of excessive speed unless they could prove he was driving that fast and it was unsafe for the situation. Many police and emergency vehicles are now being geared with AVL systems that allow supervisor's to keep tabs on the operator's speeds. From what I've heard though, they are not disciplined until it is shown to be a chronic problem.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Big Ron <bigron@ematic.com> wondered:
> I was curious if there is a "Privacy Code" table for FRS radios that
> give the CTCSS tone for each?

As FRS radios are intended to be bought and used in pairs, the
manufacturers tend to ignore compatibility in their use of the 'standard'
tone set. In particular, at least one Radio Shack series used the Alinco
additions and dropped the last eight of the ham tones.

From the FAF - Frequently Asked Frequencies
on http://www.strongsignals.net/htm/oak_faf.htm

CTCSS (PL) Frequencies

Freq Designator Freq Designator Freq Designator
(Hz) EIA Ham (Hz) EIA Ham (Hz) EIA Ham

67.0 L1 01 107.2 1B 14 173.8 6A 28
69.3 WZ 110.9 2Z 15 179.9 6B 29
71.9 L2 02 114.8 2A 16 186.2 7Z 30
74.4 WA 03 118.8 2B 17 192.8 7A 31
77.0 L3 04 123.0 3Z 18 203.5 M1 32
79.7 SP 05 127.3 3A 19 206.5 8Z
82.5 L4 06 131.8 3B 20 210.7 M2 33
85.4 YA 07 136.5 4Z 21 218.1 M3 34
88.5 L4A 08 141.3 4A 22 225.7 M4 35
91.5 ZZ 09 146.2 4B 23 229.1 9Z
94.8 L5 10 151.4 5Z 24 233.6 M5 36
97.4 ZB 11 156.7 5A 25 241.8 M6 37
100.0 1Z 12 162.2 5B 26 250.3 M7 38
103.5 1A 13 167.9 6Z 27 254.1 OZ

Motorola differs from EIA with: XZ (L1), XA (L2), XB (L3),
YZ (L4), YB (L4A), ZA (L5). ICOMM does not use 97.4 and uses one
less than the amateur numbers above that (i.e. ICOM #25 = 162.2).
Alinco and others add 159.8, 165.5, 171.3, 177.3, 183.5, 189.9,
196.6, 199.5 to the standard set.
Each frequency is approximately 1.035 times the prior one,
with adjustments at 100 & 200 Hz.

Does anyone have a list of the marine band frequencies
and the channels they correspond to?

And the purpose of each channel?

Are there marine frequencies on UHF and Shortwave also?

Does someone need a liscence to transmit on these marine
band freqs?

thanks

Use a simple discone on a tall mast. Coax is best. N connectors are the only waterproof connectors. Yours should work great in S. Florida.

Go to your friendly neighborhood small airport office (FBO) and ask them for the airport facilities directory for your area. Also ask for a local sectional chart. That'll have all the airports and all their common frequencies. It will also have the approach frequencies for the major airports on the chart. Finally join AOPA (Airport Owners and Pilots Association) and you can get their airport directory... lists runways, and all NAV/COM freqs of interest. I'm a pilot and these are the resources that I use.

I'm looking for crystals for the Bearcat IV scanner. I'd love crystals for 2 meters, some VHF police and rescue and paramedics, etc. Please email me if you can help.

3642. Formula 1 Frequencies for Montreal

Newsgroup: rec.radio.scanner
Date: 2000-06-01 00:00:00 UTC
From: Y Know <hunter8567@home.com>
Message-ID: <n1jZ4.3266$Eg7.143748@news1.rdc1.on.wave.home.com>
Source record: 87463

Does anyone know the frequencies that will be in use by the F1 teams at the Canadian Grand Prix in June?

Message-ID: <20000531215641.22664.00000963@ng-cr1.aol.com>
Source record: 87465

US military VHF-Hi land mobile frequencies are from 138.0 to 144.0 MHz and 148.0 to 150.75 MHz in NFM mode (12.5 kHz steps). US military VHF-Hi aircraft frequencies are in the same range, but in AM mode (25 kHz steps).

Suggest you take a look at :

http://www.frequencyuk.co.uk/motor.html

However... Be aware that the teams can and do vary their frequencies
from one track to another, in part because the local licensing agency
may not allow certain frequencies and in part because the teams don't
like other teams listening in. You may find searching for their
frequencies a bit of a nightmare, as F1 races are a media zoo and
there's heavy RF all over the place.

The antenna you describe sounds like a standard Motorola UHF whip. The
SP50 is capable of operating between 450MHz and 470MHz. Unfortunately,
that's all the model number can tell you. If you know who is using the
radios, you may be able to use one of the online searching sites to
track down the user's frequency.

Hi, Ken,

Here's a starter: check out the frequency database at the Percon DataFinder, located at http://www.perconcorp.com/ . I recommend that you go through Rich Wells' Strongsignals Database at http://www.strongsignals.net/ to get there (click at upper right corner of home page). A search for all transmitters in Milton WI gives:

PerCon DataFinder - SPECTRUM - FCC Frequency Database - Transmitters in a City
PerCon Corporation > PerCon DataFinder > FCC > Spectrum > City >

Check out the new BaseStAR from Summitek!

As a citizen you don't need to take an oath to hold law
enforcement accountable. Many is the time, I too, have filed
complaints, and taken actions to hold hot dog troopers to the
standard of behavior specified by law.
Remember, he is a law officer. You are a citizen. In this country,
at least theoretically, he works for you. Sometimes, they need to be
reminded of that.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120

Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the

scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models

are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/. |

Other frequency web sites include: |
http://www.fordyce.org/scanning/ and |
http://www.scannerway.8m.com. |

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or

anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the

channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have

the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus

service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also

archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://dune.globe-net.net/~rc123/Robert/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements

Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters

Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)
Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable
Oct 1999 - Plectron R700 series monitor receivers
Nov 1999 - Uniden Bearcat BC278CLT clock radio scanner
Dec 1999 - Uniden Bearcat BC248CLT clock radio scanner
Jan 2000 - Radio Shack PRO-92 portable scanner
Jan 2000 - Stridsberg Engineering FLT201A FM Notch Filter and
MCA-204 Receiver Multicoupler
Feb 2000 - Yaesu VR-500 portable wide coverage receiver
Mar 2000 - Uniden Sportcat SC-200 portable scanner
Apr 2000 - Understanding Intermod,
(comparison intermod performance of several models)
May 2000 - Radio Shack PRO-94 portable
Jun 2000 - Radio Shack PRO-2052 trunk tracking base scanner

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1

second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob

Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to

the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic.

Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good

scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob.

Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging

capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring

Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn

on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft.

Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 -

612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size

and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6		X		no
FR2512	24	X			no
FR2513	24		X		no
FR2514	8	X		yes	no
FR2515	8		X	yes	no
FR2516	10	X		yes	yes
FR2517	10		X	yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years

ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

Are you sure about that? They are PUBLIC SERVANTS. Their salary is
paid with YOUR tax dollars. Usually employees DON'T pay their
employer, it's the other way around.

Which says a lot more about your level of service than it does
about my level of citizenship. I wasn't referring to an officer who
was trying to help me. I was referring to an officer that was out of
line. Morphing the argument from one topic to another is not an
effective tool of communication.

If you'd like to know what happens when I do need a police
officer, and one shows up who is willing to 'serve and protect',
I'll be glad to discuss that with you. But it is not the topic here.
Regarding an officer who behaves as though he believes he is above
the law, I stand by my statement.

You write like you are going to pop a gasket. Take a chill pill and
settle down. They aren't out there to just 'piss' you off. You
really need to get into something less 'exciting' instead of chasing
cop cars. And I thought only dogs did that :~)

Didn't try and I don't want to better places to spend my time and money. Who needs a damn test to operate a CONSUMER oriented electrical communication device in the 21st Century? I use a cellphone, GPS receiver, cordless phones, computers, TV, VCR (I can actually set it too :)), High-end Home Stereo remote, FRS devices, CB radio, Palm Pilot , RC cars and boats and even a microwave oven and I don't need a damn license for those. What makes HAM gear soooo complicated I need to pass a test and be TAXED on it by the FCC?

By the way Jim who the hell are you gonna MORSE with? Aliens, Russian SPY ships, the Space Shuttle, clandestine operatives so deep under cover that they can't afford voice transmission equipment (poor bastards). So, who the HELL do you Morse too in the 21st century??? MORSE is DEAD. dot dot dot dash dash dash dot dot blah blah blah HA HA HA :) :) :) You guys kill me.

Man you guys crack me up get with the times folks your HAM hobby is as OBSOLETE as my VIC-20 and C-64 are to 1Ghz CPU's. Let the FCC use the space for something more useful, at least more interesting. Hell I'd buy a GMRS unit once the FCC re-allocates frequencies, manufactures mass produce (a la FRS), drop the price and licensing bullshit. I can see a uses for a 5-10 mile communication device on UHF, FRS is neat but limited. Technology WILL not stand still for long, I would love said GMRS with built in GPS, terrain mapping database, hell throw a cellphone , scanner, personal organizer and MP3 in there too, sell for $300.00 - 500.00 sweet. The future looks good to me at least.

3676. List of the rec.radio newsgroups

Newsgroup: rec.radio.scanner
Date: 2000-06-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8h7j3t$mc8$1@news.hawaii.edu>
Source record: 87347
Cross-posted to: rec.radio.info,rec.radio.swap,rec.radio.scanner

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

The Constitution says that anyone who works for the government works for us "the People." The Supreme Court has explained on several occasions that the people have authority over the government, not the other way around.

Holding a police officer, or any other public servant, to a standard of reasonable and lawful behavior is an absolute RIGHT of a citizen of the United States.

Well, if you spent a little time learning about ham radio, you would
be able to answer your own question. For one thing, unlike the other
electronic devices you described, ham radio gives you the capability to
broadcast on multiple radio bands, using considerable output power, and
using several different operating modes. A computer, home stereo, tv,
cell phone, CB radio, or other similar devices, do not have any of those capabilities.

> Man you guys crack me up get with
> the times folks your HAM hobby is as
> OBSOLETE as my VIC-20 and C-64 are
> to 1Ghz CPU's. <snip>

There is a greater demand for radio, and ham radio, today then there
has ever been. The list of devices using radio, and agencies using
radio, has grown considerably, and will continue to grow in the future.
Therefore, the need for people with at least basic radio skills is also growing.

I am looking for an original owners manual for an Icom IC-R100
communications receiver.

3682. Re: Marine Band Freqs????

Newsgroup: rec.radio.scanner
Date: 2000-06-02 00:00:00 UTC
From: F Barry Mulligan <70035.140@CompuServe.COM>
Message-ID: <8h851u$54s$1@sshuraaa-i-1.production.compuserve.com>
Source record: 87353
Cross-posted to: rec.radio.scanner,alt.radio.scanner

jui@rwi.com asked:
> Does someone need a liscence to transmit on these marine
> band freqs?
If your vessel does not fall under international conventions requiring
a compulsory radio watch, there is no license requirement for standard VHF
radios. This does not, however, allow you to transmit from your home or car.

> Does anyone have a list of the marine band frequencies
> and the channels they correspond to?

From the FAF - Frequently Asked Frequencies
on http://www.strongsignals.net/htm/oak_faf.htm

Marine VHF [80.871]
[80.373]
Ch Ship Ch Ship

60 156.025
1 156.050 61 156.075
2 156.100 62 156.125

Go with the discone. If you are not going down below 100 MHz I do not
think you need the center vertical. I believe that was added to give 6M
ham (50 MHz) coverage. Read the specs. The vertical is NOT part of the
original discone design! A true discone to cover down to 6M is pretty
big.
You may want to consider a wide band preamp mounted at the antenna with
a switch in the shack. Some are available that allow you to control /
power them through the feed line! With 75' of coax it will help with
line loss. Also use the lowest loss coax you can afford. 75' of RG58
won't pass much @ 800 MHz! Look for 9913 or one of the substitutes.
Even these will have a good amount of loss @ 800 MHz.

Just updated!

I have listings for Central/South Central Illinois and St. Louis MO area
amateur radio repeaters....
Stop by my site and check it out....

Also, a lot of scanner frequencies for the area including: St. Louis
Cardinals, Chicago Cubs, Goodyear Blimp and FEMA (nationwide)

No ads, completely free....
Any updates? Let me know.
Link to/from my site? email me. Link me to yours!

Many believe the Collins made R-390 to be the best there ever was
for SW. There are those that reserve that vote for the W-J HF-1000.
Ten-Tec's new RX-340, however is making allies at a rapid rate. Time
will tell whether it measures up to the challenge.

Dc-Daylight? Icom R-8500, R-9000 or AOR's AR-5000

Obviously a dummy that couldn't learn morse code.
Go buy a study tape and study harder. LOL
Long live morse code and ham radio.

In a previous article, <alal403313@aol.com> writes:
>i would like to know what is the difference between a military radio and
>commercial recievers.what are the pros and cons.thank you very much.

In most cases the military radio has been built to very specific
specifications called out in the contract and built using mil spec parts.
These specifications are usually very stringent, far beyond what a consumer
is interested in. Some of these specifications are the enviornmental
conditions the radio must be able to function in and they can be very extreme
as well (temperature, rain, dust, etc.). Built in smaller quantities, the
military radios also tend to be much more expensive.

This expired eBay auction has a nice table of FRS Privacy Codes vs. PL frequencies for about six models:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=326033027

I have FRS radios from Cherokee and Fanon Courier, and each came with a table in the manual of PL frequencies to their Privacy Codes.

3697. Speech Inversion Descrambling

Newsgroup: rec.radio.scanner
Date: 2000-06-02 00:00:00 UTC
From: ctpds49@aol.com
Message-ID: <20000602144922.09039.00000316@ng-fg1.aol.com>
Source record: 87368

Speech Inversion is accomplished by mixing the speech spectrum
(typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some
audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz
constituting the speech inversion.

Thanks to all those that replied. I think for my needs a discone is the way to go and the NIL-JON is just way too big and expensive.

I just put the Radio Shack version up and am happy with it. I replaced my worn out Grove Scanner Beam which has survived 10 plus years of Minnesota weather. I was looking for something more directional that my discone and this meets my needs. I have been doing some ACARS listening and where the discone barely picked the airport the Scantenna did a great job. So far it also does pretty well across the bands. The only thing I have not tried yet is getting some skip which the scanner beam did real well at for me.

3709. Sacramento trunk tracking system...

Newsgroup: rec.radio.scanner
Date: 2000-06-02 00:00:00 UTC
From: davidm3123@aol.com
Message-ID: <20000602174626.12117.00000639@ng-ch1.aol.com>
Source record: 87380

Recently, there was a request for information on Trunk Tracking in the Sacramento area. I am reposting a Trunk Tracking system that was so helpful to me. I was struggling with trying to get the sacramento area organized on my 895 but was having quite a bit of trouble with talkgroups and ID's. I came across this and have been using this method since I took it off the internet and would like to share. I am sure Jay would not mind.

The system works very well -- I highly recommend it.

Thanks again Jay..

Subject: Using PRO-90/BC235XLT on a large trunking system
From: Jay O'Brien <w6go@xxxnospam.com>
Date: Wed, Jun 17, 1998 00:04 EDT
Message-id: <35874045.45B12966@quiknet.com>

FROM: Jay O'Brien June 16, 1998
w6go
@
quiknet.com

TO: New Users of Trunktrackers, BC235XLT / PRO-90

This is a discussion by a "new user" of application of the BC235XLT/PRO-90 Trunktracker on a very large trunking system. This discussion is specific to the Sacramento County system, but it may be helpful to others. I hope so. Page numbers reference the PRO-90 Owners "Manual".

I purchased a PRO-90 to monitor the Sacramento trunking systems, specifically the Sacramento County Sheriff's talkgroups. This is what I learned is called a "Type II" system.

Starting with the confusing and error filled handout from Radio Shack, I obtained many conflicting lists of frequencies and talkgroups from web pages and individuals. After sorting out all the bad information, I entered the 27 real frequencies and started searching for talkgroups so I could compare what I heard with what I found on the web.

I quickly found out that there are at least 200 active talkgroups, and with a lockout limitation of only 100 talkgroups I was not able to get down to just the Sheriff's Talkgroup ID codes. But, I was able to determine that there are several IDs used that are not in any of the listings. That's when I learned that there are 15 additional IDs which can be used for each Type II talkgroup ID. I found out that if I

programmed in the Type II ID for the Sheriff's North channel, 8208, that I was missing traffic when it was "patched" to the East channel. Under those conditions, the ID code was not 8208, but 8211. I also noted 8210 while searching. The Type II IDs are 16 apart, but the intermediate 15 can also be used. I found many instances of IDs not divisable by 16.

Thanks to help from users of the rec.radio.scanner and alt.radio.scanner newsgroups, I learned of the Trunkcom mailing list and several web pages with helpful information. I learned that the "weird" ID codes were offsets used to indicate special purpose use. To be sure to hear all ID possibilities of the Sheriff's north channel, I would have to enter 16 different ID's! Then I learned that the "Type I" IDs are inclusive, that is one Type I ID would monitor a group of Type II IDs, exactly what I needed. The Type I size codes using "S-1" are perfect, as each will hear 16 Type II codes because the byte that designates the 16 individual possibilities is ignored.

I then created a list of Type I (size code S-1) ID codes, one for each of the Type II codes in use. I switched the PRO-90 from Type II IDs to Type I IDs and entered the new codes. Now I don't miss anything. Also, by grouping the codes into the five scan lists, I can, with the push of one button, enable or disable 10 IDs at once. I have entered the 27 frequencies into four of the ten banks, and I have set up different scan lists on each.

One of my banks has scan lists which include ONLY Law enforcement. One is ONLY Fire and hospitals. One is a combination which serves my daily purposes. Each bank has up to 50 IDs, in five scan lists of 10 IDs each. In my combination bank, I have one scan list which has Sheriff's channels 1-10, one with Channels (mode) 11-16, one with the Sheriff's special ops channels, one with 10 fire channels, and one with Park Rangers and Animal Control. I can toggle each scan list of 10 on and off during scanning by just pressing the appropriate number, 1-5.

I'm still refining exactly how I have the five groups of 10 ID's arranged, and I assume that everyone would have slightly different needs. However, here's what I am using now for my combination bank's scan lists. I change this on almost a daily basis, based on what I hear and on occasional "search" mode operation.

General Monitoring
Bank 3

Sheriff Dispatch
Scan List 1
1 100-1 Ch1 North (Type II ID is 8208)
2 100-3 Ch2 East (8240)
3 101-1 Ch3 South
4 101-3 Ch4 Mode 4
5 102-1 SD5 Airport
6 102-3 Ch6 Mode 6
7 103-1 Ch7 Mode 7

8 103-3 Ch8 Mode 8
9 104-1 Ch9 Mode 9
10 104-3 Ch10 Records

Sheriff Tactical
Scan List 2
1 116-1 T1 Mode 11 (Type II ID is 9232)
2 116-3 T2 Mode 12 (9264)
3 117-1 T3 Mode 13
4 117-3 T4 Mode 14
5 118-1 T5 Mode 15
6 118-3 T6 Mode 16
7 105-1 SD11
8 105-3 SD12
9 108-3 DET1 Main
10 100-1 Ch1 North (repeated here so I can switch off scan list 1
(and concentrate on North and Mode 11-16)
Sheriff Special
Scan List 3
1 112-1 NARC1 (Type II ID is 8976)
2 112-3 NARC2 (9008)
3 113-1 NARC3
4 113-3 SPOP1 SED
5 114-1 SPOP2 SIB
6 114-3 SPOP3 SHARP
7 115-1 SPOP4 AERO
8 115-3 SPOP5 General
9 109-3 DET4 Warrants (8816)
10 110-1 DET5 Expl EOD

Fire
Scan List 4
1 040-1 Announce A (Type II ID is 2576)
2 040-3 A1 Dispatch A (2608)
3 041-1 A2 Command 2 (2640)
4 041-3 A3 Command 3
5 043-1 A6 Tac 6
6 043-3 A7 Tac 7
7 046-1 A12 Tac 12
8 046-3 Admin A
9 047-1 Prevention A
10 047-3 Arson A

Rangers, Animal Contr, etc.
Scan List 5
1 216-1 Parks & Rec Announce (17424)
2 216-3 Parks & Rec Mtce (17456)
3 217-1 Rangers Dispatch
4 217-3 Parks Tac 1
5 218-1 Parks Tac 2
6 218-3 Parks Tac 3

7 164-3 Folsom PD Dispatch (12336)
8 272-1 Animal Control (21008)
9 272-3 Animal Control
10 2106-1 Probation (23184)

To try this scheme, put the 27 County channels into a bank. The "real" 27 frequencies are as follows:

866.1125 866.1375 866.3500 866.3750 866.4375 866.6375 866.7500
866.8125 866.8375 867.1000 867.1625 867.3500 867.4125 867.4375
867.6250 867.6875 867.8375 867.9375 868.1375 868.2375 868.2875
868.4375 868.5375 868.6125 868.7375 868.9375 868.9625

Now, to switch the bank to Type I (S-1). Turn the radio off, then back on and select the bank by pressing Trunk. When both "bank" and "trunk" are flashing, press the number key to select the bank. A "P" and the first frequency will be displayed. Follow instructions on page 49, steps 1-8, Programming a Fleet map, using E-1 and USr. Use size code S-1 for each of the 8 blocks in the "fleet map".

Follow the instructions on page 41, Manually storing IDs into Scan Lists. When it asks for "block number and fleet number", enter the codes above before the "dash". The "subfleet number" is the number after the dash. For instance, for Sheriff's Channel 1, North, enter 100, press period, enter 1, press E.

After all are entered, you may want to lock out "records", for instance. When listening to that channel, press L/O. At any time later you may hold down L/O to determine which IDs are locked out and release them as you wish. See page 38. Note that you may only lock out a total of 100 IDs across all ten of the banks.

You may wish to ignore Scan list 5 (Rangers/Animal Control, etc). When scanning, you will see five dashes, 1 through 5. Those represent the scan lists and may be toggled on and off by pressing the corresponding number. Press 5 to turn scan list 5 on and off. See page 43, scanning the scan lists. If you have more than 5 dashes showing, press the PRI key to switch back to the scan list display (see page 44, just above "Scanning Type I....").

And, to remind yourself which of your ten banks you have selected, press DATA (see top of page 38) while scanning.

By the way, here's the conversion formula to go from a Type II ID to a Type I (S-1) ID:

The first digit of the Type I ID is the Type II ID MOD 8192: Remainder MOD 64 for the rest of the digits before the dash, remainder MOD 16 for the digits on the right side of the dash. Example, Type II ID 21008. 21008 MOD 8192 is 2, remainder is 4624. 4624 MOD 64 is 72, remainder is 16. 16 MOD 16 is 1. Thus the Type I (S1) ID is 272-1.

My next project is the Sacramento City system.

An additional factoid: Apparently if you have already programmed talkgroup ID's using Type II ID's (8208, for example) and you switch the radio to type I, the Talkgroup IDs will appear to be converted to type I codes. I haven't tried this! But, what I understand is that even though the IDs look fine, they won't work. You must re-program them. Just a word to the wise.

I hope this is helpful and helps others in the way I have been helped by others already using the Trunktracker. One of the biggest problems I had was finding key items in the Owners Manual. Hopefully my references here will allow others to avoid some of the frustration I encountered.

The new Winradio 1550 leaves Icom so far behind that it's not funny.
Regarding memory banks, it's now got memories organized
in a tree like in Windows Explorer. You can download
the software plugin called Advanced Memory from
http://xrs.winradio.com to see how it works (first you need to
download the Winradio receiver software from
http://www.winradio.com/home/download.htm).
It's just great.

Now there is also the Winradio Radio Basic
see http://www.rbasic.com. If you can write Basic programs,
you can get a free Winradio 1550. I am sure going to try,
wouldn't mind having two of these....

Hope this helps,

Use a discone and if anyone asks, tell them it's a TV antenna. Under federal law, no homeowner's association may restrict you from erecting a TV antenna, as long as the highest point does not exceed 12 feet above the roof line. Due to their wide-band characteristics, a discone can and does work when used as a TV antenna.

How much money ?

If you are a national government then there are a lot of choices out there. If you want to stay below say $250,000 a radio then your choices are a bit more limited.

Hey Sycho...

When all of the support infrastructure that makes your
electronic goodies fail, will you be able to communicate with
anyone about anything?

We will!!

I can make a small spark-gap transmitter (better yet, three or
four spark gap transmitters) from a busted up transistor radio.
If I happen to have a few hundred feet of wire, I can generate
electricity with my bare feet.

Can you? Can you tear apart an apparently dead battery of cells
to determine which cell(s) is bad, remove it, and get useable
current from the rest?

Can you generate a distress signal using only your wits and and
a pile of electronic "junk"?

You don't understand the art of amateur radio.

See you on the island! Going rate: Two quarts of water (de-
salinated only) for 2 minutes on the transmitter.

JB

3722. Pro-50 scanner question...

Newsgroup: rec.radio.scanner
Date: 2000-06-02 00:00:00 UTC
From: "-=[niNja]=-" <computerhampster@myhouse.com>
Message-ID: <lc0hjs4tp8gadl9jqok35th4jj32de9uet@4ax.com>
Source record: 87393
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have a Pro-50 scanner that someone hooked power up to backwards. In addition to blowing a trace, I believe it burned up a component that I can't identify. It's a small, flat, square, black device with three legs. There doesn't appear to be a location number silkscreened on the PCB. The numbers on the device are:

1R0
103

The first two legs are directly across the power/charge jacks and the third leg appears to go to the power on/off switch.

With it having three legs, I can't figure out exactly what it is, or what the third leg is for. I figure that it is some sort of protection device, but I'm not sure. Does anybody know what this is and what to replace it with?

I'd really appreciate ANY help you could offer.

Anaheim has it's own also, because of the fact they have two
helocopters in the air. If Anaheim was sharing with someone else,
the helocopters transmissions would wipe out any other traffic on
the channel

They are all good receivers, however, they are starting to show their age, and with age comes minor problems. The Icom IC-R71a is known for needing certain capacitors replaced as they get older. The Kenwood R-5000 had an issue with solder joints breaking down with age. The Yaesu FRG-100B does not have a numeric keypad, and I think has been discontinued. I'm not real familiar with the NRD-345, so I won't comment on that one.

Newer radios have newer features! Check out the Drake R8B, the Icom R-75, both have built-in computer interfaces.

Hi,

Ever since the PRO-92 came out I've wanted one. Of course the negative comments have kept me from running to R/S though. Well, when I saw the latest sale I took the plunge. Just wanted others to know what I found.

First, the complainers were correct. Mostly.

I've owned about every scanner you can think of over the years...still have a R7000, RZ1, 235, AOR8000, etc. But I wanted to be able to do LTR trunking on UHF and 800. The alpha tags would be nice too. I thought.

Went to the Shack yesterday and bought it. Hmmm, funny it already has batts in it and is programmed for the local 11 channel Smartnet II system. I found out real fast that this open/closed stuff is for the birds. Also the thing locks on the control channel and sits there. You have to LOCK it out EACH time you turn the radio on! I even called 1800theshack today and spoke to someone about this. They told me to take it back since it is broke! I went to the local store and they let me try another...same thing. Must be the radio...Also they told me they had no knowledge of scanners and I should call 1800the shack!

Backing up to last night...I programmed a local 800 LTR system. Of course on most LTR systems the carrier comes up for about a sec every 10 secs...How 'bout that, the 92 stops each time and I hear a pop. Wow! you should hear this 5 channel system ID! The 92 does not mute the carrier or ID's..here I have a popping radio that ID's in CW one channel at a time. A bunch of crap if you ask me. I tried to hold a talkgroup on LTR and it seems to just sit on the same channel and you only hear that talkgroup. Of course it misses a lot of comms since it doesn't appear to scan the other channels..

Oh yea, the backlight...WHAT backlight? I had to do a double take after pushing the light button!

I bought this thing for trunking. It does not work well at all for that mode. As a conventional scanner it is very good. The audio is nice too. You know, they even put the ground on the DC jack in the middle and the hot on the outside? How stupid?

Well it goes back this weekend.

Dewayne

on a trunked system you can have multiple agencies using the
system. Here in the Hattiesburg/Forrest County MS area. We have all the
Vol Fire Depts, PD channels, SO channel, AAA Ambulance Fire Dept's for
both Hattiesburg and Petal, Ms. All the city and county work crew and
agencies (ie sanitation, road crews), etc
on the system. Using what's call a talk group they divide the trunk
syste, up.

I hope this clears up your question

On the Radio Shack Pro-92 Scanner. What do I need to program the Talk group ID codes for the EDAC trunking. I have set the freq's in the correct Logical Channel Numbering order. I do not understand how set the ID #'s themself into the scanner. Any help would be appreciated alot.

Thanks.

Connect two clip leads to the batteries. Connect one clip lead to a
rusty file. Drag the other clip lead over the file in Morse Code
sequence. <grin>

I've heard C.W. transmitters that sounded like they were built that way.

Ron, about the VX-5:
You may be transmitting on FRS but you are lucky to get 1-2 watts out (At most). The VX-5 doesn't like anything about about 158Mhz, and the performance drops off dramatically after this.

Also it burns up the finals alot quicker.... Heed the advice of a VX-5 Owner: Only use the lowest power setting when on FRS. Don't trust me on this advice, but trust my Hewlett Packard Oscilloscope.... It doesn't lie!!!

Big Ron wrote:

Cecil....

I'm betting you are a good guy, but I'm also betting that you are baiting me.

If you are an EE, and you don't know how to build a spark-gap transmitter, then I'm sure that I'm not the one you need to be talking to.

See my response to Glen for starters.

Also, remember that in my first post in this topic, and in those posts following the first, I am communicating with someone who relies on the understanding and promise of performance from others rather than on his own technical 'understanding of the concepts' himself.

Again, this is not a question of legality or of polite, logical discuurse. To me, it is a matter of practicality....there are those who "CAN" when it comes to radio wave communication, and those who "CAN'T".

Those who "CAN" are those who understand the art of amateur radio (or, those who understand the technical essence of radio telecommunications in general, for those who like to split hairs), and those who "CAN'T", meaning those who rely on others to provide them communication services, and who have NO idea of how to arrange the same service for themselves should their enablers fail at the task of serving them.

In a nutshell, I am considering those who "talk out of their butts" against those who have the technical saavy to be "CAN DO" operators.

Discussions along any lines other than these are based on a failure to understand my point of departure, and a failure to understand the difference between a technically saavy ham and the qualifications of the intended recipient of my first post.

Basically, discussions along any other lines than these betrays that the dissenting poster didn't understand the difference between the original poster's comments and my response to those comments.

Regards!

JB

Anyone care to share the best way to put PL-259connectors on RG-6 coax with a minimum of loss? I've read a few articles on the subject and the consensus seems to be "lots of heat!", but I'm still having trouble actually getting it to work. Should I try soldering or just use solderless connectors, or does it matter? What consitutes a "good" RF connection as compared to just a "good" electrical connection?

Anybody who really used the Pro-92 pretty much concluded it is junk on trunking and cool on convention scanning.

There is a new mobile trunk tracker from Rat Shack that DOES monitor the data channel, so it is as good as a BC245. This prove the shack knows there is a problem and their new radio has a better design. I predict a new handheld (pro-92 replacement) that will monitor the data channel. That would be the big ticket item to buy.

Both radios have PC interface cables. There is a free program that will
download frequencies Directly to your scanner. Although it is not very
good since the frequencies are all jumbled in the scanner and you must
reprogram the scanner. You can however use the PC cables to run programs
that will control the scanner. There are several for BC245, but I'm not sure
about the SC200.

>
>I have a BC235XLT now, but need another scanner. Should it be the SC200

If you don't need trunking then the SC200 is the one to go with.

You're talking about the new IC-R3! I think a lot of us know about it, but for now, it's out of reach, until the FCC approves it. From past experience, this process can take a long time.

IC-R3 SPECIFICATIONS

GENERAL

a.. Frequency Range: 0.495-2450.095 MHz
b.. Mode: FM, AM, WFM, AM-TV, FM-TV
AM TV one of either NTSC M, PAL B or PAL G systems
FM TV for 900-1300 MHz, 2250-2450 MHz ranges only; not available in some versions
c.. Frequency resolution: 5 kHz, 6.25 KHz
d.. Number of memory channels: 450 (8 banks of 50 channels plus 50 scan edges)
e.. Antenna connector: BNC (50 ohms)
f.. Operating temperature range: -10&#65533;C to +60&#65533;C ; +14 F to +140 F
g.. Frequency stability: &#65533;6 ppm max.(-10&#65533;C to +50&#65533;C)
h.. Power supply requirement: 3.6-6.3 V DC (negative ground)
i.. Current drain (at 4.5 V DC):
a.. At rated output: 210 mA typicak (backlight off)
b.. At stand-by: 140 mA typical
c.. Power save: 53 mA typical
d.. TV reception: 730 mA typical (color LCD on)
j.. Dimensions: 61 (W) x 120 (H) x 32.9 (D) mm; 2 13/32 (W) x 4 23/32 (H) x 1 9/32 (d) in.
k.. Weight: 300 g; 10.6 oz

RECEIVER

a.. Receiver system: Triple-conversion superheterodyne
Quadruple-conversion for above 1150 MHz
b.. Intermediate frequencies (unit MHz) AM, FM WFM C3F(TV)
U.S.A. Europe
1st 240.1 240.1 241.85 *1, 238.35 *2
2nd 26.05 13.25 45.75 38.9
3rd 0.450 0.450 ---

*1 30-799.995, 1321-2099.995 MHz range
*2 800-1320.995, 2100-2450.095 MHz range
c.. Sensitivity (typical):
a.. AM (at 10 dB S/N)
a.. 0.495-4.995 MHz: 1.4 &#65533;V
b.. 5.0-29.995 MHz: 1.0 &#65533;V
c.. 118-136 MHz: 0.79 &#65533;V
d.. 222-329.995 MHz: 1.0 &#65533;V
a.. FM (at 12 dB SINAD)
a.. 1.625-4.995 MHz: 0.32 &#65533;V
b.. 5.0-469.995 MHz: 0.25 &#65533;V
c.. 470-799.995 MHz: 0.45 &#65533;V
d.. 800-1999.995 MHz: 0.56 &#65533;V

I would be totally p/o'ed if I found out that my tax payer dollars spent $250 k for a radio receiver, unless it
was one of a kind special unit to avoid loss of lives.
Otherwise, this cost would clearly indicate a no-bid situation, as in a politician rewarding a company.
One could even build a super cooled low noise amplifier into a receiver for less than that.
Al

I have an ex-brother-in-law who worked for the Memphis PD who told me he
was once pulled over for doing 115 mph but they let him go. I have also
ridden
with him on several occasions. In addition I know several local police
officers who
admit that they speed because they can get away with it. No one can
convince
me that officers don't break the law because they can!!!

Jack,
I too lost the radio in my 91 Explorer. It was cheaper for me to just buy one on the net from someone who had upgraded to a fancier stereo. Think I paid about $100.00 bucks. There are many 91 radios laying in garages I suspect. The guys are right about the ford news group. Thats where I found mine.

By the way, all the paint has fallen from the roof and partially from the sides on my 91 Explorer. Hows yours?

I want to purchase this item. I hope this is the right name for it. (It is supposed to help you find freq. if you put it near something that is transmitting.)
Anyway can someone recommend the best one to buy either new or used that does not require me to buy a special scanner to hook it up to?

Also for those who have been to Hamfest before. What is the right terminology to use to ask someone if the scanner they are selling isn't blocked? LOL or did I just answer my own question?

Also what software if any should I look for that will help me hook up my scanner (Pro 2050) to my computer and be able to listen, etc.?

You can email me directly if possible or here is fine....

Thanks.....
Vonnie

William - Here I have now been called "wacky" by Blake Bowers. Yet, I haven't
been involved on this thread in any way. Blake simply chose to try to attack me
for his pleasure. William, it is sad how Blake tries to harass. He has made harassing
phone calls to my elderly father (retired military), which the county authorities tracked
to a phone listed in Blake Bowers' name. Blake has also harassed me on newsgroups
& e-mail. Now you can see he is still harassing me trying to start a problem with you
here on this newsgroup. Blake loves to cause trouble & get negative attention on this
newsgroup.

Indeed, Blake Bowers has proven himself to be the wacky one!!

Blake, I advise you to follow your own advice and "Offer an intelligent opinion or
information and you might be able to have a discussion someday". Because, most of us don't
"have time for usenet retards" like yourself.

> These specifications are usually very stringent, far beyond what a consumer
> is interested in.

Well said. For that reason most of mil equipment have no "bells and whistles"
So one of the best SW-RX for broadcast listening!!! is the JRC NRD-535 with all
options and full with filters of your choice.
Ability to switch to an IF-filter wich is optimized to specific listening
situations is VERY important when "hifi-sound" is important to you. So you may
want 20 filters between 2 and 20 khz and a good syncronous detector.
For "station-hunting" and readability only some smaller bandwidth filters
between 1 and 6 khz are enough. Your favourite operation mode then is listening
in SSB-mode on the sideband which is working better on specific situations.

> Some of these specifications are the enviornmental
> conditions the radio must be able to function in and they can be very extreme
> as well (temperature, rain, dust, etc.). Built in smaller quantities, the
> military radios also tend to be much more expensive.
>

..so in addition some of the newer military equipment includes digital decryption
features you will never get on the free market... :-((which makes them just
more expensive.

If you are really interested in military equipment you can get such as surplus
from different dealers --like "Singer" here in germany--. They always have some
nice Harris, Plessey, Siemens..... :-) .
for a fraction of its original price. But be sure the RX of your choice has all
additional options you want to have. It is nearly impossible to get them
afterwards or you have to pay VERY much for it. You may never get such quality
for that price on commercial stuff.
Be aware that most of military RX's need a really good antenna and do not work on
a whip-antenna like a Sony portable.
Military SW-equipment is not built for sensitivity but for selectivity and
dynamic range.

One of the best active antennas you can get -if not THE best- is the HE011 from
Rohde&Schwarz -germany- it is for about DM 1200 app. US$600 plus S&H.
Maybe there are better ones -but ONLY available for gouvernment use.....-

As someone statet in a german mailing list the "ALA1530" from Wellbrook in UK
outperforms the "DX ONE" by numbers.....

have a look on

If anyone ever hires this jackass for GRAPHIX they better double check his spelling, pronunciation, word tenses and any other GRAMMAR errors he will make.

Would anyone buy a sign or HTML from someone who calls others profanity on a public newsgroup.

Why should anyone trust his perverted opinions. He sounds like he is coming off an overnight binge of some illegal narcotic.

Too early in the morning to RANT and RAVE!

Hey dipshit, first of all you don't know me and you have no idea what I do. I could care less if I spelled something wrong or used improper grammar on a newsgroup or not. Who cares,the body message is what is important. And the message is you and people like you are trying to rip-off the uninformed.

I hate typing shit (that's what secretaries are for) and the shorter I can make it the better for me. By the way as far as spelling and grammar are concerned there are people (dopes who earn shit money because they are so busy worrying about spelling and grammar they can't do anything more important or creative) who proof stuff prior to finishing any type of commercial job. You looking for work? Also, there are devices known as COMPUTERS that can check spelling for you.

In closing, I will re-iterate what I said before DO NOT PAY this scumbag $60.00 for a $15.00 interface, you want to throw money away send it to me instead!

3778. FS: DR-599T Dual Band Mobile w/full 800Mhz

Newsgroup: rec.radio.scanner
Date: 2000-06-03 00:00:00 UTC
From: Al <mwm@reidnet.com>
Message-ID: <8hbhmd$qb4$1@nnrp1.deja.com>
Source record: 87323

Hello All,

The ALINCO Model DR-599T is a dual band transceiver
offering big value in a small package.
The independent main band and sub-band operation permits
full duplex operation, w/crossband repeat abilities.
offers 30 memory channels (15 per band), high/med/low power,
four scanning functions, full reverse operation at a touch,
priority, call and ABX functions. The 37 selectable sub-audible
encode tone frequencies can be called for encode or
encode/decode (tone squelch CTCSS) decode optional.

Detachable front panel is easy to read and understand.
The LCD lets the operator know at a glance which functions
are in operation. Beep and bell tones can be added or deleted
as desired.

Minor mobile scuffs, face excellent condition. Comes with manual,
power cable and mobile mounting bracket, duplexer,
Air band rx and full 800 Mhz coverage w/ antenna connection.
$265 shipped.

Thanks
AL N4GOD

Sent via Deja.com http://www.deja.com/

3779. Re: Alternative discone antenna construction

Newsgroup: rec.radio.scanner
Date: 2000-06-03 00:00:00 UTC
From: Radiskull <Radiskull@usa.com>
Message-ID: <Lwb_4.3099$Bc3.25778@typhoon.tampabay.rr.com>
Source record: 87324

Actually, I believe the first discones were solid cones. At least that is how I learned them back a million years ago in college. The aluminum rods for the cone were just more practical for wind loading.

I believe the key in any discone is the angle between the ground plane (the flat top) and the active elements. It mus be as 'sharp' as possible in order to get true octave range.

The plastic should have no effect, especially since it would be behind the active part.

Try it, let us know how it works.. sounds like a good project -- just keep in mind the wind loading if you put it up high.

cheers

If the pl259 is not recommended for use above VHF then why do the antennas for scanners come with them? I would much rather the antennas come with bnc just like the scanners have but no, you have to buy a pocketful of adapters to get the stuff to work right. And for the last time, scanners don't care about 75 vs. 50 ohms impediance, that is a dead horse, use a search and read one of the last 50 times we had to kill it in here....rg6 is LOTS better for scanners, the rg58 signal loss is really significant. Go to the belden website and read stats if you don't believe me.

> for scanners come with them?

Mostly because they're durable as hell and common. BNC connectors
wear out rather quickly -- a few hundred connrections or
disconnections to maybe a thousand or two. Also, the impedence
"bump" UHF connectors have have is usually not significant at VHF.

> I would much rather the antennas come with bnc

The software RCSS sucks... If you want a good package look for ARC8000 software...
And you can build your own interface for a few dollars, just a max232 you can get free from Maxim... the connector can be made by a small piece of pcb...

I've seen a number of > $250K radios and they often where done on multiple bid jobs. The real question generally was just how many screen rooms did you need to buy to house them. The cost of buying the real estate wasn't included in the price ....

Looking at it another way - if you are talking about "the best receiver military or commercial anywhere" why would it not have a super cooled / super conducting front end ? If you put one on the radio, why do it for only one band ?

Obviously it all depends on what you need to do and what you are trying to achieve.

If your radio receiver spots incoming missiles via passive radar techniques it'll cost you way more than a couple of million a copy and still be cheap.

If the job you want your radio to do is to the CBC while sitting here in CT then you paid to much if you went over about $200 or so. At $200 you didn't get the best receiver in anybody's book. You just one that is good enough that you can't tell it from the best when doing the job you want it to do.

What most people are looking for is a radio that is good enough at doing a specific job. The problem is they rarely want to define the job ahead of picking out the radio.

Most of us in the real world have a limited amount of money to spend. To some a RF-590 or a WJ-1000 is simply to expensive at > $2K to even consider. To others it's a reasonable thing to do. It's a whole lot easier to pick out the best radio for < $xx, <$xxx, or <$xxxx than it is to pick out the best radio period.

If the idea is to help make a choice it can be done better with more information ....

Bob

Want to be able to save scanner info for going to different car racing series. Heard there are new cable interfaces that link (upload/download/image) from a PC. I've been looking at all of the Scanner pages including Uniden, and they just don't cover the PC interface questions.

I have a BC235XLT now, but need another scanner. Should it be the SC200 or the BC245XLT. Is trunking that big a deal if I know what freq the drivers are using?

And how can I get AM/FM freqs when they broadcast at the track?

That same "circuit" was in one of Radio Shack's Engineering Notebook
series (a collection of booklets for electronics beginners).

Let's not forget that spark (Class B emission) wasn't banned until
1 January 1966 as per the 1959 Geneva International Radio Conference.

>Care to describe how to do it?

I suppose you could use the wire from the ferrite loop antenna to
make a step-up transformer; you'll need to construct an "interrupter"
and place it in series with the primary so the battery voltage is
pulsed. Use some metal from the radio's frame to make two opposing
electrodes -- they're in series with the transformer's secondary.
It can be made frequency-agile by making a tuning circuit from the
the 365 pF variable cap and one or more of the inductors. It will
be as broad as a barn door -- some stages of filtering can be
added using components from the transistor radio.

A "clean" spark transmitter was discussed in detail on the GlowBugs
email list some time ago.

Got to go watch for the NASA satellite observatory's re-entry --
it's supposed to crash into the Pacific within the next half-hour;
six tons of it is supposed to survive the re-entry.

What a con man. I know what your auctioning CAUSE I BOUGHT THE SAME items
you are auctioning probably from the same place.
AR8000INF and RCSS AR8000 CPU software is (was) sold a package sold by EDCO.
AOR 8000 Reaction Tune cable to OptoElectronics Scout and battery cover are
(were) also sold as a package.

Interface is OK, But software SUCKS and company who made no longer supports
it , buy ARC http://www.butel.nl/ 100 times better.
Battery cover with slit?? Slit yours it's FREE :)
Scout cable = 1/8" phono plug on end of flat cable?

Please take keep your CRAP "BLOWOUTS" on eBay and DO NOT TRY and take
advantage of users on this newsgroup or you will be exposed again.

Because it doesn't do you any good at all. For almost 50 years,
ultimate receiver sensitivity has been limited by atmospheric noise.
We have simplified tuning, we have added try synch detection, and we
have added DSP audio processing, improved the image rejection a
little, and improved the shape factor in the IF, but the basic
sensitivity of the receiver is no better than it was 40 years ago
because kT noise in the atmosphere is the limiting factor, not front
end performance.

I think you will find a Collins S-Line receiver, or a Drake 2 series
from the 1960's is every bit as sensitive as the best you can buy
today.

If y

At radio frequencies, surface area is the name of the game, which is
why braid is often used for RF grounds. Electricity travels on the
surface of the conductor at radio frequencies, due to something called
the skin effect.

So for instance a 10 gauge wire may give an excellent Electrical
ground, and be able to carry 30 amperes easily because the skin depth
at 60hz is on the order of .7 inches in copper, however it can only
carry a fraction of that current at 6Mhz because it might as well be a
hollow tube a few microns thick. No electricty travels except on
surface.

Lots of heat means just that. Not a 25 watt soldering iron, or 100
watt soldering gun, a propane torch or a 300-400 watt iron is what's
called for. It allows you to make very large contact areas, which is
exactly what you want to do.

it,or just use for a scanner/reciever?
If for a receiver,I would just put an F connector on it,then use one of
those female F to 259 adaptors from radio shack.
If for a transceiver,I wouldn't do it,seriously.I would go buy some
other coax.A lot of the RG-6 has aluminum wire and the foil,and won't
solder worth a crap anyway.And even when the braid is copper,it's
pretty weak,and even with an adaptor in the 259,it doesn't fit very
well,and the single strand center wire usually breaks if it flexes much
at all...

Racal??You mean Collins don't you?It's popular for a couple of reasons.
It,if in ok shape and aligned,has great AM performance,and a digital
readout(mechanical).Another thing,it's pretty impressive looking.
As far as the best ones on the market today,the Rockwell Collins
HF2050 is up there,there are several others,ranging from 2000 and up
USED.The performance is slightly better than a high end hobby type
radio,but the construction and ease of use is usually better.

Murphy's surplus,WJ Ford,Ebay(there are almost always a few),surplus
sales of Nebraska,and more,go do a search(for exact phrase) on "Surplus
Receivers",and you will get a bunch of links.Then there are the marine
radios,and there are a few places selling those too,they are roughly
equal to the military ones.

Hey it is a reality. They already demonstrated a pre production model of the new Uniden at the Dayton hamfest a few weeks ago. You can read more about this and other exotic news on the 4phun-radio@eGgroups.com mailing list.

If you become a member of 4phun-radio@egroups.com you can access the message archive with your web browser. Go back about 100 to 150 messages and read all about the new Uniden 780 radio including pictures etc. There is even a link to downloading the pre production User manual in PDF format so you can learn how to use the radio before it is even released.

You will find extensive information over the past three months about the Pro 92 and why users find it unacceptable as a trunking scanner.

Most RG6/U cables are intended for MATV/CATV and feature an aluminum foil shield in addition to aluminum "drain wires" or additional braided aluminum shield. You cannot solder to the aluminum. Some high end video RG6's do have a copper shield. Either way the reducers for PL259's do not have a large enough bore to fit RG6 (UG176 is the largest; intended for RG59 cables)- and there is not enough material to allow the reducer to be reamed. Install a standard F connector using a hex crimp tool. Then use a PL259 to F adapter- the loss is unmeasurable.

With that said- did your post mean RG6 or RG8?

Why would anyone in their right mind want to put a PL259
onto RG6 cable? This type of coax was designed for use in
75 ohm systems. The PL259 was designed for use on 50 ohm
systems. The connector was never made to mate with this RG6
cable.

Try using the F connector that was made for the RG6 coax.
Crap shack has them rather cheap. You just crimp them on
and keep trucking.

If you intend to use this setup for transmitting, then go
get the correct cable. RG58 or RG8 has the 50 ohm impedance
of most of today's radios.

Had the same sorta of thing happen with mine a couple of years ago. The scan, PGM, and enter keys all went south on me after a horse and I had a discussion about right-of-way in the stall and scraped me (and the radio, which was on my belt) along the wall, grinding off about half of each of the three buttons, and putting a scuff on the case.

It's an easy fix: Talk to Tandy about ordering a new keypad. I'd suggest getting a couple of 'em if the price is still in the $6.00 range, since the shipping on two or three will be the same as for one, and in my experience, the keypad is the single most failure-prone part on a 43.

NOTE: AVOID the droids at Radio Shack and talk directly to Tandy National Parts. The droids'll try desperately to sell you a new scanner, and then after you've beaten them off with a large stick, will finally agree to "try" to order your part, foul it up, then claim there's no such part, then start trying to sell you a new scanner again - Oh, and don't forget you'll need batteries with that! <grumbles about incompetent twits>

Radio Shack will sell you both the PL-259 to F adapters and the crimp on F connectors to do the job as well as it can be done.

RG-6 isn't real good stuff for transmitting, but it works just fine for reception. The main reason to use it is that it is cheap and easy to find. There are other cables with lower loss and higher power capability.

Even the RS adapters are good enough that you can't measure the effect they have on a receiver. They also work ok outdoors if you protect them the way you would any UHF series connection.

Hope this helps

Bob

Source record: 87263
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Just to clear up one point...I'm using it for a scanner antenna. I got the RG6 because I thought the loss would be a little less than RG58. I didn't know about the aluminum shield at the time, and everyone that has posted saying "you can't solder to that!" is absolutely right....

Just to pass time this afternoon, I might try wrapping the outer conductor with copper, then tinning it, and then soldering the whole mess into the PL259.

The reason I'm using PL259 connectors in the first place is that I'm building a discone and the feedline is a copper pipe with a metal rod in the middle. The inner conductor is soldered onto a SO-239 connector at the bottom because it fits the pipe pretty well, and I can get a good connection between the metal rod and the pin on the SO-239. I could have rigged up another type of connector at the bottom I guess, and if I run into a lot of trouble I might just run down to RS and pick up an F connector...

Thanks for the help...I'll post when this damn thing is put together.

Hi Jim,

Actually, the UHF series of connectors (PL259/SO239 is not a constant impedance connector. i.e. it does not have a uniform characteristic impedance. This is why it is not recommended above VHF frequenceis. Type N (Neils) , BNC (Bayonette Neils-Concilman) or C (Concilman) are constant impedance.

Anyone aware of a software package to program frequencies into a IC-Q7A? I also need an interface cable.

The Icom web site suggest this is possible with an IC-R2 but doesn't mention the Q7A.

Many thanks!!

Mark

I have Kenwood R-2000, and agree with filter comments. It is also a bit

noisier than it ought to be, but otherwise not a bad unit for backup
and SSB phone work. I have an ICOM R-75, and I will argue with ANY
owner of an under-$1000 (new price) receiver that it is the BEST. Mine
is enhanced with ICOM optional CW and SSB filters, as well as DSP. My
other four receivers include Drake SW-2 (SWL program w/very good S-AM),
Yaesu FRG-7 with Gilfer modifications to IF strip (MW-ECSS and backup
SSB) with all usual FRG-7 beautiful audio and stability), Kenwood R-600
("boomer" SW stations) and Realistic DX-398 (nightstand favorite and
take-along champion, unsurpassed features).
I also have three VHF/UHF units going, including twin PRO-2050 trunk
monitor scanners (local PS trunks) and a Uniden BC-895XLT (Best $200
scanner --new price-- available today).
I am still learning to acquire MCHB (multi-channel human brain) audio
processing, to handle the traffic!
One,my JRC 525,was hooked up to my PC,slowly searching U.S.

Sure it does, Cecil. You pull out the ferrite antenna
in the radio and unwrap the windings. Use it for the
file scrape thing.

Glen...Do you recommend Farnsworth or straight
timing for good file work...;-)

Ever since the silly designers decided to make the 800 big enough to BE
a table!! Did you see the photo in MT (I believe), with a Sony
2010--which is no compact unit itself--placed atop the Grundig 800?
That new 800 isn't a radio, it's a BUS!!! (chuckle)

3866. Re: Good connections on RG-6 coax?

Newsgroup: rec.radio.scanner
Date: 2000-06-04 00:00:00 UTC
From: "M. Schneider" <markinokla@juno.com>
Message-ID: <rVw_4.2047$EU3.9488@newsfeed.slurp.net>
Source record: 87275
Cross-posted to: alt.radio.scanner,rec.radio.scanner

After some of the nonsense I've read in the replies to this, let's clear up some things. First, did you get PL-259 connectors made for RG-6 coax? Use the proper connectors and you won't have any problems making the connections. Second, most (not all, but most) antennas have SO-239 connectors, so you have to use PL-259 connectors to mate to them. Yes, I know how superior N, BNC, TNC, F connectors are, but you still have to mate to the antenna. Under the K.I.S.S. rule, put the proper connector on the coax to mate to the antenna, then weatherproof the connection. Third, under broadband receive-only operations, the impedance miss-match "problem" is not a problem. As the frequency varies, the impedance varies also, there isn't a perfect "50 ohm" match except at a few frequencies. The lower-loss characteristics of RG-6 (particularly RG-6 QS) more than makes up for any potential loss due to impedance miss-match.

This is what I did, I purchased RG-6 QS (Quad Shield) and the proper PL-259 and BNC connectors to fit. After attaching the connectors to the coax (BTW, I don't recommend use ing a propane torch. I have a 300 watt Weller soldering gun) and fastening them to the antenna, I wrap the connection with coax connector sealing tape (not electrical tape). I have a discone antenna at 30 feet and on at 20 feet and my nominal coverage is 100+ miles on VHF and 80+ miles on UHF, depending variables such as terrain, power and antenna on the other end, etc.

Mark K5MAR

PS I wonder why antenna manufacturers continue to use SO-239 connectors on VHF/UHF antennas? Even my ham antennas (Cushcraft AR-270) use SO-239 connectors.

Source record: 87277
Cross-posted to: alt.radio.scanner,rec.radio.scanner

So it appears that Menlo Park Mall, a Simon Malls company, in Edison, NJ,
no longer ops on 464.4375, PL 192.8Hz. The FCC's database
http://gullfoss.fcc.gov:8080/cgi-bin/ws.exe/beta/genmen/index.hts indicates
VHF freqs now in use for Simon Mall(Menlo Park) in Edison, though it
doesn't say for what capacity.

I found it very interesting that the VHF freqs they listed are weird
offsets, such as 153.2525MHz. The closest a Motorola HT1000, which is what
they're using, can come is 12.5kHz spacing of 153.2550MHz.

Anyone have anything more to share?

Regards,
Tony

writes:

Today is Wednesday, 5/18, I'm leaving Friday for DisneyWorld and
can't
find the freqs!
Here is a list I got while online......

OK, for all of you guys that can't put your radio down when you go on
vacation - The (un)official list of Walt Disney World Frequencies.
(I'll give you a hint... I work at the Magic Kingdom, so this is
about
as official as it gets.) All of these frequencies are confirmed; They
were obtained from WDW Radio/Audio Central a:nd traffic has been
heard on
each frequency.

Anything with a * indicates simplex and probably very low power. (The
radios we use at 20,000 leagues are only 1 watt for operators and 4
watts for leads) If you don't hear anything, don't yell at me about
it,
you just aren't patient enough!

151.895 20,000 Leagues Under the Sea *
452.650 Cash Control (Wells Fargo Trucks) *
463.975 Custodial Base (EC and MK)
469.3375 E - Stops (Attractions) *
148.100 E-Stop Great Movie Ride *
462.550 Entertainment 1 (Characters)
461.300 Entertainment 2 (Parade Dispatch/Traffic)
464.9375 Entertainment 3 *
464.500 Entertainment 4 (Special)
453.825 Fire Channel 1 (Reedy Creek Fire Rescue)
463.750 Hailing (Disney - MGM Studios)
464.125 Hailing (EPCOT Center)
464.400 Hailing (Magic Kingdom)
154.47875 Light Barges (Electrical Water Pageant) *
462.675 Maintenance 1 (EPCOT Center)
464.625 Maintenance 2 (Magic Kingdom)
464.800 Maintenance 3 (Disney - MGM Studios)
462.650 Operations 1 (EPCOT Center)
462.575 Operations 2 (Monorails)
462.625 Operations 3 (Magic Kingdom)
461.600 Operations 5 (Disney - MGM Studios)
464.600 Operations Simplex *
157.740 Pagers (no input)
462.775 Pagers (no input)

462.850 Pagers (no input)
464.0625 People Finder *
468.8125 Point of Sale Systems *
462.475 Reedy Creek Energy Services
464.200 Resorts 1
461.700 S.T.E.P. (Fireworks)
151.655 Space Mountain/Riverboats/Studio Trams *
451.500 VUT
461.3375 Warehouses 1 *
461.9125 Warehouses 2 *

Also, Disney is steadily moving a lot of stuff to a 12 channel
trunked system
in the 800's. Currently, Security, Resorts, and Watercraft (plus some
V.I.P's)
use the system. I've seen the charts, and most of the traffic will
move there
within the next few years. Also, Disney should be setting up a 900's
trunked
system also. So, many of t non-theme park frequencies may be moving
there. .

If you would like to know who to listen for on each channel, give me
a note
at:

Internet: cwagar@ducvax.auburn.edu
America Online: "YenSid1"
Fidonet: 3613/13.20 (I think...)

Also, if you have any good frequencies to trade (especially State of
Florida
or
Alabama) drop me a line. I spent a good part of my summer sitting in
Walt
Disney World searching for frequencies... I'd like to think that
someone
appreciates it......!

Well, that's all I have (and that's alot!). Happy Scanning....!

There is no need for this to continue. Please
end it now.

By now John has seen that his messages were incorrect, in that
he wrote them to and about the wrong person. I am sure he
is man enough to post an admission that he was incorrect.

There is no need for this kind of mudslinging to continue
on the newsgroup.

Even less need for it coming from a anon server.

This looks to be the holy grail of handheld wideband receivers. In addition to boosting the high end of frequency coverage up to 2.45 GHz, this unit also adds VIDEO RECEPTION! You can view the new wireless cameras and even watch TV on this thing. The ability to view wireless cameras is going to be a killer app at the least. You can take this thing out to an auto race and watch your favorite racers doing their thing. You can also tune in a wireless surveillance camera in your neighbors' house and see what they're up to. The screen is a 2.5" active-matrix LCD and the unit can also be connected to an external monitor or VCR or PC video input card. Heck, plug this thing into your laptop and you've got a roving webcam!

I saw the ad for this thing in June '00 PopComm. Icom's website www.icomamerica.com might have some info on it too.

Well, actually this thing hasn't been released just yet, but Grove is taking
reservations for it. Look for the price to be somewhere in the neighborhood
of $500 to $600.

Robert,

I would get a cheap F - female to F - female barrel connector and make that the termination on the discone. Then do the F connector thing on the RG-6 QS and you are in business with minimum trouble.

Bob

>QUOTE"Does anyone know if it's possible to get the 245's firmware updated?>I would think it should be possible with the data cable somehow,
>either by modem, or sending it back to Uniden..??"....
I don't think the "Firmware" can be erased or changed by the data cable input, it's a part of the scanner that is permanent, kinda like you can't "make" your 486 into a pentium by "uploading" something into the computer from a data cable connected to the serial port, & my guess is that uniden won't upgrade scanners sent in, for a reasonable cost if at all. But it would be interesting to hear from anyone who calls Uniden service for a cost to do this (good luck even finding a customer service operator that even knows what your talking about!!!).....

>Tom
>ems477@accesscable.net

Hi Tom,

You're a little ahead of yourself here. After selecting the
trunking option for the bank, you have to enter the frequencies.
You cannot enter the frequencies first, then set the bank for
trunking. After you let it search to show that it's working, you
can create some scan lists of talk groups. Each trunking bank can
have 10 scan lists of 10 groups each, and the scan lists can be
individually disabled, like frequency banks in regular scanning.

This is all described in the manual, which you can download from
the Uniden web site if you don't have one.

Cheers,
Peter

Hello Tony,

The weird frequencies are the result of FCC refarming, which has created new narrowband channels halfway between the existing 15 kHz spaced channels.The maximum deviation is +/- 2.5 kHz., which is half of normal.

In your example, 153.2525 is exactly halfway between 153.245 and 153.260 which are in the industrial pool.

Motorola HT-1000 portables, version C and above will do the new narrowband standard, which includes 2.5 kHz frequency
stepping.

Mark

I used to lurk in this newsgroup a couple of years ago, but got busy restoring an old fire engine so have not been spending much time in the usenet newsgroups. I am back tonight because of this very issue. I live in Tustin, a town next to Irvine, and as of the first week of May I am no longer able to listen to the local PD on any scanner I own - including my recently purchased BC985XLT and BC245XLT trunk trackers.

I have read about 7 replies to the orignal post, and while it has been mentioned that Irvine is among the first group of law enforcement in Orange County CA to switch over to 800 MHz trunking, what nobody has mentioned is that the system seems to be unmonitorable by conventional and trunk tracking scanners (at least, the ones I have) because it is both digital and encrypted. I am not sure all the channels are encrypted all the time, but all of the law net is digital which just sounds like a lot of garbage noise in both conventional scanning and trunk tracking modes.

Does anyone know of a scanner that is capable of monitoring a *digital* truncking system or is there software that someone has written to do this? Has this been discussed in this newsgroup?

I am more of a fire person anyhow, so for the time being I am at least happy that I can lock out all the DIGITAL law talkgroups (annoying noise) and follow all the ANALOG FD radio traffic just fine. Thanks to friends at OCFA, and Motorla, I have all the info on the different cell sites, frequencies and talk groups now used by the FDs. Most of the FDs are on the countywide cell, but Santa Ana FD and Costa Mesa FD are on the South Cell, which are different (new) frequencies than the "old" 800 MHz freqs. If anyone is interested I can e-mail or post all the info for the FDs - I don't think you can get the specific configuration of the 5 new cell site groups out of any book yet and if you just start programming all 80 frequencies you won't be able to properly follow the talk groups. (Well, you won't be able to follow the law talk groups anyhow!)

Oh, another really important thing is that the frequencies are assigned to the talkgroups by Cell Site region (North, Northwest, South,

Southwest, Laguna, and Countywide) and NOT by agency. So, yes, the digital law enforcement talk groups are using the very same frequencies as the analog fire talk groups, so you can no longer get away with just programming the 800 MHz fire freqs in one bank of your scanner and listening to them in conventional mode (and hitting the scan button a lot to do "manual trunk tracking" - seriously, several firefighter friends have been monitoring the FDs this way ever since ORC went to 800 MHz). This is because the digital noise from the PDs now sharing those freqs locks up the scanner every couple of minutes - and it is a very annoying sound - much like a loud verison of the computer chip in those toy firetrucks to make it sound like a diesel engine idling).

Mike Britt

WoW. I wish your EOC was my EOC director. My county won't spend anything on improving or repairing ARES/RACES gear.. But they sure like to call on us for those nuke plant drills and bad weather.

I guess that is why our members are dwindling.. Only folks left are what I call the "walking wounded". Retired, disabled, or like me, too stupid to realize the county and FEMA don't give a sh*t. Plenty of lip service, plenty of BS, no resources. BTW has nothing to do with the county having high tech resources.. all it takes is one car accident into the "right" telephone pole to take out the entire fire communications system.

When we die off , move, or find something better to do at least EOC will still have their cellphones to handle emergencies.

The AR5000+3 with optional mechanical filters would get my vote.
HF is just about as good as my R8B. UHF and below is about equal to
Optocom/Pro-2006 scanners. AR5000 doesn't do trunking though, if
that's important for you. Lots of reviews on the AR5000 if you do some
searching. Good luck.

I just bought the SC200 from Racing Electronics. If you purchase from them, they will program the radio for you at the track so you don't even need to know the drivers freqs. They also include the AM/FM/TV broadcast freqs. I know of only one program for "PC Programming" and that is from Pozilla, Winscan sport. I've been looking for others but no luck yet. If you have any questions, Email me.

It's not true everywhere. The fire chief of a neighboring community (Northbrook, IL) was in Florida when hurricane Andrew blew through. He saw there how hams were the only ones who were able to communicate after the storm. After he moved here, he had hams added to the village's emergency plan. We have a radio room in the EOC and the fire dept. has purchased tens of thousands of dollars of ham and emergency equipment (antannas, generators, portable radios, etc.).

I always use a resistance soldering tool to solder PL-259's.
A resistance soldering tool heats the item to be soldered by passing AC current through the item and the heat is generated by the resistance of the item.
A simple resistance soldering tool can be made from a 5 to 6.3 volt filament transformer rated at 20 Amps. The soldering head looks like a tweezer and the electrodes are nichrome welding rods cut to approx. 1" length. Look into hot wire wire strippers (for teflon wire) for ideas on how to make the "tweezers". (mfg.: Teledyne and Ideal)

Hi there,

Like the subject line said this will probably be the millionth time this question has come up, but I am interested in buying a scanner and really have no idea what model to get. I have done a bit of research and with my limited knowledge, I at least figure I would like a Trunking scanner, and something which is capable of monitoring a fairly wide range of freq's. Something of good quality, which I can get the max enjoyment out of..

Thanks, Jason

Jason:

I think right now the most bang for the buck, in a desktop unit is the Uniden Bearcat BC895-XLT. Street price is around $200.00. If you want a hand-held, probably the BC245-XLT, also going for around $200.00.

Come on Cecil! You're not cutting me any slack. I could go get
my "tune in the world with Ham radio" primer to find the answer,
but instead I'll just say that I can cause an electromagnetic
disturbance just by walking accross my floor and grounding out
on a doorknob. If I find a way to do it on demand by recharging
my source potential quickly, then by touching two conductors
together to effect the discharge, then I am even more efficient.

Remember the (primary)recipient of my original post, and you
will see what I was getting at (I think you already see it and
now you want to twist me a little bit).

Remember that in my first response post, I didn't mention
radiating efficiency/ ERP at all!

In that post I was also careful to mention that I could find a
way to generate the power (sorry, EMF potential) if I had only
enough wire (and I could, and you could too, so don't ask me
how!) A few capacitors in series from the transistor radio to
enhance the discharge, and a switch, boy, I'd have the best
highly enhanced S.G. transmitter on the block. That's all!

_ _··· ···_ _

JB

p.s. I was thinking of using my own human energy to turn the
speaker magnet inside a coil. Can you tell me that , in theory,
it wouldn't work?

How are you going to do that with capacitors rated for
ten volts maximum? I'm giving you a hard time about making
a spark-gap transmitter out of a transistor radio which is
manufactured with low voltage parts. If you had said instead
that you could make one out of wire, a file, and a car battery,
I would not have said anything.

The same thing here in Midland County Michigan.
The hams get called up for just about every general emergency, from flods,
chemical spills, and "weather" (we get tornadoes and sever thunderstorms in
the summer and the occasional blizzard in the winter)

> > We also are a key part of a program that will lower property

We have a radio station set up right in the EOC along with the 911 operators
and central dispatch.

There is both a 2 and 440 rig along with packet and probably before long
APRS.

We don't have nuke plants nearby, though we will be doing some hazmat drills along those lines.
They ship N-waste and fuel up and down I-69.
As for bad weather, who needs drills :) We get plenty real stuff! It's been at least once a week lately. EC indiana isn't widely known as tornado alley, but we get the highest frequency of F4-F5 in the country. Oklahoma and such get the most of the F1-F2s.

> I guess that is why our members are dwindling.. Only folks left are

> fire communications system.

When we were going into Y2K, Bill had us set up and be available for backup to the 800 MHz system.
We didn't need to take anyone off parties and such, but we had plenty commitments for no alcohol, and have radio on hand. He fully realizes that it's a system that's great when it works, and when it's down, it's useless.
Our stormchase team has CB and 800 at the moment, (800 is useless out of county) but we are training them up for ham tickets, especially the leader, a phD meteo.

> When we die off , move, or find something better to do at least EOC
> will still have their cellphones to handle emergencies.

ROTFLMAO

I was just out on a skywarn run last week, we had a downburst that sent a bunch of trees down in one neighborhood. I was out of the car, so I tried to call in on cell, and as it turned out, the same little storm killed eight cell towers. No coverage.. Had to come back to the car and use good old ham radio again.

We haven't seen any capacity jamming here lately, but it's almost
certain to happen in any real incident.

> long APRS.

I am working with Steve Bragg on a "skywarn" version of the HamHud
for APRS.
http://www.c2-tech.com/~steveb/hamhud/
The idea is to let you enter messages with the "whiz wheel" like:

Tornado at 2 miles NE moving 20 mph E
or
Hail here size quarter

This is in a "fill in the blank" format. It calculates positions
relative to your current position.
Other Hamhud units will hear these messages and interpret, so that
tornado might display on my HH as:

Tornado at 5 miles S moving 20 mph NE

along with a beeping alert for tornado, wall cloud, and large hail.

The idea is that the user dosen't have to interpret, it's all
relative to your current position.

It runs "smart beacons" which make it dramatically easier to track
mobiles than the original fixed interval beacons.
It beacons whenever there is a significant change in your course, so
every corner gets "pegged", but when you are stopped, or cruising
straightline, it only beacons at a slower rate just to keep track.
(the web page has better descriptions)

We run APRS, and SSTV, along with VHF voice for the main net, and UHF
for tactical.
Three SSTV mobiles now, on 146.565 with Chromapix at the EOC.
HF capability also, but I don't see a lot of call for that in
localized events.
Our VHF "reach" is about 100 miles, anything that big, then I guess
we heat up the HF gear :)

I just picked up a Sony ICF-SC1 for $99 (delivered) from Electronics E
Mall. Nice radio for the price, it doesn't do trunk tracking, but does
cover 25MHz-1.3GHz (minus cellular), and there's a lot between those
freqs. You could get the PC version for a little more, would make
keeping freqs organized a little easier.

You might check for IMD sources. Aircraft usually run low power from relatively high altitudes. My airplane radio only puts out 10 watts. There is little reason to use more unless you cruise at high altitudes. Airliner radios have more power, but they usually don't use the high power setting close to the ground.

Chances are that if you're picking up aircraft radios on 154 to 156 MHz, you're getting a very strong signal which is inducing mixing products in your scanner. Go find that signal and then maybe someone can help you get rid of the problem.

Source record: 87048

A scanner using an IF of 10.7 or 10.8 MHz (common scanner IF's) could receive strong signals from aircraft 21.4 to 21.6 Mhz lower in frequency. If there are FAA frequencies in your area in the 132-134 mHz region, you may indeed be receiving "image frequency" signals.

An open circuited piece of solid dielectric coax about one foot, two and five eighths inches long, connected in parallel with your antenna input, will notch out the aircraft frequencies. You may experience some loss due to the capacitance of this cable, but that can be tuned out using a shorter , short-circuited coax, about 10 and 3/4 inches long, connected at the same place as the other one. This will peak your reception for 153 Mhz (approx.) and insert a notch at about 133. It will also cause losses at frequencies other than 153 Mhz. You may want instead to build a 140 Mhz high-pass filter.

Does anyone know what ICOM did to change the R10 from being easily modded to the European model?

My friend has the R10 with the B4901E board and did the 2 resistor mod to the European spec with no problem, but when I did mine with the B4901F board, it didn't open up the to full coverage.

What did they do?

Thanks
Scott

3937. Discone VS fibreglass antenna, opinions...

Newsgroup: rec.radio.scanner
Date: 2000-06-06 00:00:00 UTC
From: Oden <od.en@swipnet.se>
Message-ID: <MSb%4.5604$b55.14543@nntpserver.swip.net>

Hi, I wonder if anyone has any opinions about an antenna from Nevada Communications called Scanmaster Base B1300. It's a wideband (25-1300Mhz) fibreglass vertical antenna.
Is this antenna as good as a traditional Disconeantenna in receiving signals in 78-80Mhz??

I`m asking this because I can't put a big Discone on my roof (laws).
My scanner is a Uniden BC-9000, and I want good performance on 78-80Mhz, and I listen a little to other freqs between 25-1000Mhz.
This is what I need: Baseantenna, discreet installation, coverage 25-1000Mhz (especially 78-80Mhz), to work with Uniden BC-9000.

Any suggestions about choosing the "right" antenna...

Oden

OUCH! At least you don't have rats, and the KPC-3 and computer is
sufficient for APRS :)

Ours used to be "secure", but when the new director took over, he
pulled all the blankets off and made it useful.
Turns out a lot of the "security" was apparently to conceal how
little was getting done.

We are down the hall from 911, but have free access to it when
needed.
We also have backup radios for police, fire etc in our room, should
we need to go direct, and the authority to use them. (covered under
EOC, not FCC)

We still have one hardline that got wet, but we sealed the top end
about a year ago, and this friday we will light it up with UHF and
check for loss with a couple of birds and a dummy load. If it looks
ok, then we'll use it for HF and cell phone passive repeater. (not
much cell signal in the dungeon)

I just went through a similar sit, thursday before dayton.
Got the dents to prove it too.
I just missed the band of baseball to grapefruit hail.
We did pick up one fellow on I-70 headed to dayton (ham, happened to
tune us in) and got him to pull off and wait.
He was very glad. Then, I ran into him at Dayton, when he was
telling the story :)

> Had we had ARPS one transmission would have told them right where I
> was. The biggest drawback is trying to read the screen and/or
> entering any kind of data has to take your attention away from
> driving and away from the storm.

You don't want to do this sort of thing moving, no.
The "fill in blank" format is designed to be as fast as possible to
enter, as opposed to the normal message format where every letter has
to be "twiddled" in, (like the TH-D7 HT)
Voice is best, for reporting while moving, but you know what a voice
net can be like too.
With the HH, you can fire in your reports much faster, and they are
immediately available to your buddies (with hamhuds) as well, and
interpreted relative to their position!

We're evolving the skywarn version, as we learn more about applying
it in real life.
Steve is the exact opposite of MicroSloth. His software usually
works, and he listens to users :)

> What's it do with foot to the floor acelleration<:-))
```

It will notice that you're moving within about 50', speed irrelevant.

Uniden LRD 6599SWS radar/laser detector includes:
64 voice/text alerts
5 audio alerts
360 laser detection
laser, k, ka, x bands
vg-2 undetectability
dot matrix led display
electronic memory
singal strength meter
automute feature

This comes with all original equipment and was rarely used including,
hardwire power connector, cig lighter adaptor, manuals, box, clips.

Retails for about US$129, will accept something in the range of US$65-75 or
a trade.

email me at maherdoleh@hotmail.com if interested.

The big stuff is usually quite localized. It might cover some ones yard, or
a city block, but usually not much more. Thing is you never know where it's
going to drop the next bunch.

ok so I've gathered my pro-43 needs a new keypad (scan button not working unless pressed really hard), is a new keypad a worthwhile investment for an aging pro-43 ? is it something that my local advanced electronics guru can handle(he did the opening up of the cell bands) and can it be ordered thru R/Shack ? if so how ?

thanks for the advice, Mike

I can turn around and talk to any of the 911 operators, or go to their
position if necessary. That makes it real handy for passing information
called in on to the people in the field. (typically done on packet)

> We also have backup radios for police, fire etc in our room, should

We too, work directly with the EOC, or more properly "for" the EOC. OH!
head of EOC is also a ham. He saw what we could do and promptly got his
license.

Well, we downchecked it because it was dripping water out at the
other end.
I had been sitting for seven years, in the secure secret eoc station,
unterminated, and getting water from above.
It's a pretty long bit up to the roof, 3 story building, and we're in
the basement.

Not at all uncommon, if you are using Heliax.
The center is a tube. If you have a bad connector, or none, on each end you could use it for a hose, but that won't hurt the coax..

Cut maybe an inch off the end of the ocax to check for corosion on the outside of the inner connector, and check the condition of the shield. If both are clean...then use one of those little tube cleaning brushes to clean out the inside of the center conductor before screwing in the center pin for the connector. (makes its own threads)

The stuff you don't want water any where near and take special precautions on the connectors is 9913, or equivelant. I've had water get in it and had to throw the entire length away. I'd rather spend a bit extra for semi rigid stuff that I don't have to mess with, whether Heliax or the Time Wire Stuff which I can't remember the name of.

> I had been sitting for seven years, in the secure secret eoc station,
> unterminated, and getting water from above.
> It's a pretty long bit up to the roof, 3 story building, and we're in
> the basement.

Blow it out, check it out and it's *probably* OK, *IF* it's Heliax.

What I really don't like about the semi rigid stuff is the cost of the
connectors. which run from around $35 to $75, or $80 each.

Sounds like the stuff. Andrews something or other. Spiralled
insulator.

We lucked out, our local microwave specialist had several of the
right ends in his junk box.
I picked up some more at a hamfest for $15 each.

Start Internet Explorer.

Click on the search icon on the tool bar (earth and a magnafying glass).

Enter "YUPITERU MVT-7000" (without quotes) in the search field.

Start clicking on the results in the left panel to view the page in the
right panel. You should find what you are looking for in the first 8 or
10 sites.

No models today can be sol unblocked to the general public. Thus you
have
a few options: Time travel :), buy a foreign scanner (risky), or just
give up
and appreciate what the rest of what a scanner picks up.

Jason,

Be VERY careful starting with scanners. I started about 10 years ago, with one BC200 scanner. I now have 6 scanners. Don't know how it happened, but they just have sort of shown up!?!?!

Best advice, is like LCC said, just buy one. The BC245XLT is very nice and the computer interface is FANTASTIC.

3962. PRO-2040 Discriminator bypass

Newsgroup: rec.radio.scanner
Date: 2000-06-06 00:00:00 UTC
From: Rob <rsatterfield@theriver.com>
Message-ID: <393DC1C3.5F5C3CC1@theriver.com>

Hi,

I am wondering if anyone has successfully bypassed the discriminator on a PRO 2040 scanner to receive data signals and import them into a PC. I am familiar with a few software programs that allow this but they require bypassing the discriminator. I have never done this and so far have not found a commercial device to do this. I have found some diagrams but I am not an electrician and was hoping I would not have to build one by scratch. Can anyone provide directions on how to do this? If anyone knows a website that would help me build one from scratch, I would appreciate that info as well. Any help or advice would be greatly appreciated. Thank you.

Rob

Here are some "older" model scanners that are cellular capable...this
list is from messages I saved. Also, if you are interested in buying a
new scanner (imported), try: http://www.javiation.co.uk/home.html

Subject: List of scanners that can be cell modified.
From: scanshack@aol.communicate (ScanShack)
Date: 1999/02/19
Newsgroups: alt.radio.scanner
Here is a list of the pre-ban (approx. Apr 1994) scanners of which
should be
capable of cellular restoration:

PRO-2004 BC-855XLT *3 Regency 4030

PRO-2005 BC-200XLT Regency 1600

PRO-2006 BC-205XLT Icom IC-R10 *7

PRO-2022 BC-760XLT *4

PRO-2026 *2 BC-700A *3

PRO-2027 BC-890XLT *4

PRO-2030 BC-950XLT

PRO-2032 BC-2500XLT *3

PRO-34

PRO-37

PRO-39

PRO-43 *1

PRO-46 *2 *5

PRO-51 *6

PRO-23 *6

Note 1: Date of Mfg code 1A4, 2A4, xA3, xA2 (label in battery compment),
or no
"A" in the serial no.

Note 2: Date of mfg code 1A4, 2A4, -A3, -A2 (label on back).

Note 3: Date of mfg code must not end in the letter "D", except for
OAID. (On

BC700A some OBID work)

Note 4: Date of mfg code must not end in the letter "D".

Note 5: Units with date code of 5A4 can tune cellular in 30 kHz Steps
using a
keyboard entry sequence.

Note 6: Units with date code of 6A4 (and some 7A4) can tune cellular in
30 kHz
Steps using a keyboard entry sequence. After 7A4 no mod can be done.

Note 7: The current 1998 models are (so far).

The below list are those scanners that were capable of receiving the
full 800
MHz band, without modification:

J.I.L. SX-400 AOR-950 Icom R-7100 *

Regency MX-4000 AOR-1000 Icom R-1*

Regency MX-5000 AOR-1500 Icom R-100

Kenwood RZ-1 AOR-2500 Icom R-9000

Uniden BC-800XLT AOR-3000 * Icom R-7000

Yaesu FRG-9600 AOR-8000 *

* pre-1994

Jeff,

Don't expect greatness from IC-R3 video. It's main purpose is scanning.
Next, imagine the ability to watch TV on a freq, but not hear the audio.

One interesting aspect is that you could conceivably drive by somebody's
home that uses those new-fangled 2.4 wireless cameras and get a glimpse
of their view?

Probably will quickly become a burglar's tool in that instance. NOT GOOD.

Oh well.

Perhaps there is a stationary remote cam, like a wireless 2.4 gig

Wow I thought all the homo queers like your self were left to other news groups.
I guess you took 5 mins from shooting sperm over your gram ma ma's teeth to actually work "the old pc" from your trailer park

what your sisters vd keeps your from banging her but it doesnt stop your mom from eating her as long as she spits the crap out at the end

and your dad finally dismounted himself from your pet donkeys dick to address the fact that he's related to your mom

Barry ? thats like Lance or Gary or Bob or Neil. Burke thats fucking gay as hell and jr, what your father finally got your aunt mom pregnant " duhh the pullout ,method doesnt work !!"

duhh bburke.com doesnt seem to work uncle dad ? ? duh I don't know about this internet thang works in our trailer park , I think I'll go hump my dog again

what you get bored of the pistons jamming up your ass in remote control airplanes ?? <crying> I can't fly real planes so I'll fly remotes that'll be that same won't it ? I can't cut the real thing !!

yeah please tell me all about your "real" license . " I have a real license so that means I post in the rec.aiviation.fuckmeupmyassgroup

You fag you fucking post in models rail road oh gay oh gay oh gay

"As a student private pilot, I was really starting to wonder about that takeoff" yeah I don't know how hard it is to take off with a large dildo shoved up your ass but I bet you do !!

You fucking faggot I bet you don't even fly planes real or remote, play hockey , know what the fuck a ham radio or any of the things that you "claim" to be an expert in .

"I listen to plenty of traffic on 2m, 6m, 1.25m, and shortwave. How many times can you guys do radio checks? <G> Unforunately, most hams are NOT all that knowledgeable when it comes to electronics these days. They THINK they are <G>, but most of them are simply appliance operating rag chewers. A typical ham's last piece of "electronic" experience was installing a mobile appliance in a vehicle. The only people I often hear talking about a nything other than the weather or the last micron they adjusted their antenna are the losers on 3950 on Saturday night.

Could you fix, or at least troubleshoot to a proprietary component, your own HT?

I'm not a ham operator. "

Your not a ham operator because your too busy shoving things up your mile wide ass. You have no fucking clue what you are talking about , yeah you listen and thats all you'll ever do because your a stupid stand on the side lines and comment type of fucking asshole.

FUCK YOU PIECE OF SHIT.

I have no idea where you are but please tell me and next time I'm in your little town or city I'll be sure to look you up and beat the living shit out of your either A. tired old retired ass know nothing but pretends to know it all or B. some fucking piece of shit middle age fuck who again thinks he knows it all.

It's one thing to dabble a little in all kinds of things but another to master any of them.

I know what you spend your evenings mastering you fucking homo
You probably spend afternoons in the kids playground with some candy

3972. Scanner with a good "SSB Mods" ?

Newsgroup: rec.radio.scanner
Date: 2000-06-06 00:00:00 UTC
From: gauger@my-deja.com
Message-ID: <8hhlr9$24k$1@nnrp1.deja.com>
Source record: 87105

Hi

Any recommendation for a scanner with a good "SSB Mods"

Because i want to plug my ssb receiver to the scanner IF, 455 Khz or
10.7 Mhz for receiving the VHF and UHF band in SSB.
The Pro-2006 is a good receiver at this but it is very hold and not
easy to find...
Do you know a scanner that can be use with a SSB receiver ?

Thanks for your collaboration.

A lot depends on how much money you have to spend. Don't spend every last dime you have on your first radio. Antenna(s) and other goodies will chew up some cash as well. I would agree with both the other posts, the Sony hand held is on close out right now and worth every dime (I bought two ...). The Bearcat 895 works well and it's price isn't to steep (only own one ...).

Both these radios (actually all three, the Sony comes in two flavors) are a couple of years old and something new comes out every couple of years. There are some "classic" scanners, but for your average scanning type use what's new is generally what's best (more features, lower price, cheaper construction .... two out of three ain't bad).

For a bunch of information check out:

http://www.strongsignals.net/

Another thing to consider now that it's spring and garage sale season is upon us is the used scanner market. If you spend enough time figuring out models you can find some pretty darn cheap buys on some of this stuff.

Hope this helps...

I do like this...but as far as entering inforrmation from the field I'd much rather use voice as no way can I take my eyes off the road in some situations...The ones where you have one on the road, one looking for a hole to crawl into, and one on the sky.

About three years ago, I got caught trying to beat a storm. I was crossing North to Sough, trying to get a look at the south and back side when it dumped on me. I had about 5 miles where I could barely see the end of the hood along with extreme lightening.

About the time I started to see a bit farther and it was getting a bit lighter...and the hail started. Not the little pea, or dime size, but quarter to golf ball size. I made the corner and was able to see much of the sought side of the storm. The hail was so bad (made so much noise hitting the roof) that the EOC had to keep asking my location. They finally got it and said "we just received a report of baseball size hail on that corner". I replied that the largest I'd seen was golf ball size with the most being quarter. And...I was out of there. I didn't even care if it was a rumor, I was headed for safer ground. <:-))

Had we had ARPS one transmission would have told them right where I was.

The biggest drawback is trying to read the screen and/or entering any kind of data has to take your attention away from driving and away from the storm.

With large hail, lightening, and tornadoes you can't afford to look away (safely). working as a team, or pair is much safer, but storms pop up so quickly that it's either take cover, or grab the camera and go hunting.

> (the web page has better descriptions)

What's it do with foot to the floor acelleration<:-))

Like the Transponder in aircraft you need an ident button on the rig and the ability to interrogate from the EOC, which you probably do.

>
> We run APRS, and SSTV, along with VHF voice for the main net, and UHF
> for tactical.

We also have subscriptions to real time RADAR so the images can be sent to all concerned (that have the equipment) "with permission"

> Three SSTV mobiles now, on 146.565 with Chromapix at the EOC.
> HF capability also, but I don't see a lot of call for that in
> localized events.

> Our VHF "reach" is about 100 miles, anything that big, then I guess
> we heat up the HF gear :)

We cover 30-40 miles locally, but are tied into two other systems so that our information can cover two thirds of the Lower peninsula...I've never seen an instance where we need that kind of coverage, but it is available.

We are adding link receivers so we should eventually get HT coverage for about a 30 mile radius.
>
You probably won't be able to hear anything on the HF gear any way if the lightening is intense.

many years ago...Prior to 1980, I was on a weater net on 75 meters. All of a suddent the only thing I could hear was steady static with the S-meter pegged.

My son and I went upstairs and out the front door. We could hear a very loud roar. I looked straight up into the bottom of one about (what appeared to be maybe 300 yeards up. It continued about a mile and a half north (over the village of Breckenridge) and then touched down in a corn field. 25 miles later it hit a trailer park in the outskirts of Midland. They had evacuated when I reported it on 75.

It was not a large tornado, but it sure made a mess out of that trailer park.

Around here it stands for Emergency Order of Detention. This is placing a subject in protective detention for his/her own well-being or safety. Generally it is used to commit somebody for psychiatric evaluation when it is believed they may harm themselves or others. Possibly suicidal, that sort of thing.

Mark K5MAR

Message-ID: <393CCA6F.CDF90EA0@LexComInc.net>
Source record: 87115

In very large PDs that make a distinction between "beat" cops and "Zone" cops. E.O.D. is the Emergency Operations Division.

beat cops are oriented toward Community Policing activities and are restricted to very small, highly circumscribed " beats" and may not be working 24/7.

EOD works 24/7, is always available, can go any where in the city, and responds to High priority calls (man with a gun, Domestic involving weapons, large street fight) i.e calls where more than one officer is going to be needed.

In the LAPD what would be the EOD is called Metro.

In other cities they are sometimes called floaters. i.e they can "float" anywhere, without getting special permission from higher command.

NYCPD has this kind of structure I just can't remember what the NYCPD name for EOD is.

We are not allowed in the 911 center for "security" reasons (go figure). 911 Center is in a phone company building. We got an antenna to them to install but it never was installed. Probably still laying in a box. We have two ancient 2 meter radios, one HF, one old KPC-3, one old 386 and one donated PS2 486 with a 14.4kbps modem. I donated the 386 and the modem. Two of the antennas at eoc have bad coax that we can't replace ourselves and building maint won't change out because of building construction. The generators for the building flood out with water from a local creek during heavy rains. exhaust fumes creep into the radio room. The room leaks water and plastic tarps have to be placed on all equipment.

Start Internet Explorer.
Click the "Search" icon on the toolbar. (Earth and magnifying glass)
Enter "cordless phone frequencies" (without quotes)
Press <ENTER>

Click on the results on the left side and you'll see the web page on the
right side. The first 2 or 3 sites listed have your answer.

I've got one (non-blocked if it maters). Works good the little bit I've played with it. It in fact does pick up TV (video and audio at same time) quite good. Some one mentioned they did not think it will pick up video at 2GHz with rubber duck antenna. I would not be surprised if it does okay (have not tried that yet). As for antenna, it comes with a telescopic type antenna. Of course at 2GHz, don't know if that is a benefit or not???

I'd let you all know more but I'm using this thing like I would build a new bike. If you know what I mean ;)

I asked a few of my LMR buddies and sure enough, there's no docket for
2.5kHz spacing, Mark. The newest narrow-banded analog spacing out right
now is 12.5kHz, with possible a 6.25kHz in the future but that's
unconfirmed.

3993. Lightning protection and scanner antennas

Newsgroup: rec.radio.scanner
Date: 2000-06-06 00:00:00 UTC
From: "Robert W. St. G. Fisher, IV" <rwfisher@mindspring.com>
Message-ID: <393D0A36.17CE8FB6@mindspring.com>

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Well, the discone project is on hold until I can get some better materials for a feedline. I'm going to take the copper tube/steel rod feed I've made and use it for a 1/4 lambda ground plane for VHF.

With that in mind, what are some good options for lightning protection? I live in NC and there's a pretty high risk factor for lightning strikes. Our house has a well grounded lightning rod system, but I was thinking of mounting this antenna outside its 45ï¿½ zone of protection (basically mounted on a piece of PVC nailed to the eaves). I was thinking of sticking a rod longer than the antenna alongside and grounding it with some heavy gauge wire, but am worried about what effect that may have on the antenna's properties.

I have done some research on this, but most of the material seems more applicable to metal towers (read as: lightning magnets) that have a very high risk of strike. There are some heroic grounding schemes out there.

Any suggestions? Realistically, a strike that close to the house (and my electronics) will probably fry anything that's on, and some things that aren't! I just don't want to guide a nice lightning surge through my window and across my desk.....

With that said, thanks to everyone that has entertained my previous posts (i.e. the RG-6 connection thing). When these antennas are done, I'll post how they turn out.

My Antenna Setup is Kind of straight forward and Homemade - I use a Motorola Hole Mount 800Mhz Pig Tail whip mounted on a specially fabricated aluminum plate - this is clamped to the Pole and RG-6 is attached -

Now I Use Trunker and E-Trunk extensively to Monitor so i use a 10DB Radio Shack Pre-Amp and a simple 1 in and 2 out splitter where i can use 2 radios with 1 antenna -
and i get really good Performance - which suprised me - the reception is much better than i Expected - especially with the splitter

I have Used RG-6 exclusively for the past 5 years and wont go back - it is relatively inexpensive and does a great job for recieve only applications....

Just My 2 cents worth

Get one of those little $0.79 neon light bulbs, and put it across the antenna to ground. At normal voltages it'll be an open circuit, but at anything higher than about 75 volts, it'll short across. Won't handle a huge amount of current of course, but will drain any static that builds up. Has saved me in the past, and it's fun to watch too.

Steve.

It won't effect much for receiver purposes. However a rod like that
could still cause problems. If it does get struck, you will have
damage inside.

Use the same ground system your lightning rods use. Bring the coax
down as vertically as possible and then take a ground wire and attach
it to the shield of the coax and from there to the lightning ground
system. Your ground wire should be thick, at least #10 AWG.

You may consider using units from PolyPhaser at the grounding point.
(http://www.polyphaser.com) Many hams and professional radio
installers swear by their stuff.

You need what is known as a polyphaser. This will
tap into your coax line. The polyphaser then must be strapped to
a grounding rod. Tie all grounds together, also ground the mast.
(I would use metal masting).

And that's the problem. It's fine for the small stuff, but the big
stuff will still hurt. That's protection against induced static, not
lightning.

Source record: 87139

If you live in the Eastern MA or RI area and
are an avid scanner enthusiest you may want
to consider joining our notification network.

The membership is free and the network serves
many news agencies and public safety personnel,
as well as traffic networks. (and many who just
want to know what's going on!)

As a bonus, you will be able to use some of the
repeaters for personal communication and GMRS
use. The notification group is called TAC-7. To
become part of the organization you must have, or
purchase, a business band (462Mhz) two way
radio. Used equipment is available.

e-mail me for details if interested.

4007. Best Scanner Mobil/handheld??????

Newsgroup: rec.radio.scanner
Date: 2000-06-06 00:00:00 UTC
From: satujinn@worldnet.att.net
Message-ID: <8hjdh9$b71$1@nnrp1.deja.com>
Source record: 87140

Greetings all:

I'm probably what you would consider an amature scanner enthusiast. I have been scanning for about 15 years now off and on.

I'd like your opinions on the following:

What is the best scanner to purchase with the following features... Alpha/numeric diplay, at least 200 channels BNC antenna connection, under $300/Over $300 I've heard the AOR scanners are pretty good, but it seems they are tough to get in US becasue of cell freqs. I'm curious about the sonys as well.

I'm open to all ideas.

My next question is a little tougher. I'm curious to know if any of you have rigged up a scanner in your car so that the main unit is say under the seat or at least out of sight and the buttons and LCD disply are handy. I'm no electronics expert, but I imagine you might be able to detach the LCD and run a long wire or two from the unit to your dash and have the LCD mounted there. If that can be done, I suspect the controld could be moved too. A very stealthy set up in my humble opinion.

If it's not too much trouble could you E-mail me the response as well as I'm rarley in this forum.

Alex

That's odd...considering aircraft is between 118~136Mhz AM, and police are
FM. What type of radio do you have? What are you using for an antenna?

Robert:

There is nothing on the market that will prevent damage from a direct hit of lightning, however, there are devices that will help, for an indirect strike. Possibly one of the best available can be obtained from Grove.

"Hope? There's always hope, Mr.Farnsworth." -DB

Berlin, Monday, Aug. 20, 1934 -- Eighty-nine and nine-tenths
percent of the German voters endorsed in yesterday's plebiscite
Chancellor Hitler's assumption of greater power than has ever
been possessed by any other ruler in modern times. Nearly 10
per cent indicated their disapproval. The result was expected.

4013. Navy ULF

I heard the navy has a huge antenna laying on the bottom of lake Michigan for ULF. Anyone know the freq. for ULF? Can one understand the signal once he finds it, or is it scrambled, or in a form like ritty, etc.? Thanks,

FRED

I purchased one about 10 years ago and it lasted all of those years on my roof through the ever changable Minnesota weather. I just took it down for good a couple of weeks ago, it was not performing as well and the steel parts were badly rusted. Over the years I notices that the Scanner Beam was very directional which was good for me since I am north of the Twin Cities which is the area I scan the most. It performed well across the bands but what I really liked about it was it's ability to pick up some good scanner skip. I would search low VHF and pickup a variety of frequencies from the south some that I did identify as being in Florida.

I replaced it with the Radio Shack version of the Scantenna which I like too, but I will get another Scanner Beam this summer to add to the antenna farm on my roof.

Cecil...

I know you are a very smart guy. I stumbled accross your comments in the "speed of light exceeded" topic, and now I am sure that you are having a good chuckle at my expense.

That's OK!

But remember that in my original post about the transistor radio parts being used to create a spark gap transmitter, I didn't mention efficiency, ERP, or "final stage" power of any spark-gap transmitter.

I was trying to show the fellow who bad-mouthed amateur radio that it is better to understand for one's self rather than depend on others who understand for us. It is especially curious that someone should bad-mouth the very people who are to be credited with many of the advances that give the bad-mouther a comfortable, cushy communications lifestyle.

And everything that I proposed was in line with current EMF radiation theory (granted, in a very simple way).

Twist me a little more!! But now I think I am sure that you knew where I was coming from, right from the start!

John

Cecil...

I loved the MATRIX!

But let me twist _your_ ears a little bit.

If I charge a low voltage capacitor to its capacity, and then I
short its leads, does it result in an electromagnetic
disturbance, or not?

>Oden
>od.en@swipnet.se
>
>
>
While I use a diskcone at home and at work, and I find it works very well
for the type listening that I do, I must admit that a diskcone is the
least bad antenna that I know about for wide range [50 to 1000] reception.
If you are interested in a narrow band of frequencies [like 78 to 80] then
a 1/4 wave length cut for 79MHz will work better than a diskcone.
But an antenna "cut" for one specific frequency or narrow band of
frequencies will not work far from that frequency. As an ecample,
an antenna cut for 79MHz will not work as well as a diskcone when you
get to the 150 VHF public service freqs and when you get to 400
it will be a very poor antenna. And forget about 800+MHz.
So, what type antenna you pcik, make, or modify, will depend on
just what frequencies you monitor. I listen to every thing from
6mtr ham stuff to ATC transponders at 1040[real interesting buzzes!]
Now, what is in the 78 to 80MHz to listen to? Around here we have
fire department alarm boxes on 75, some aero stuff somewhere down
there[I do not live close enough to the airport to receive and
of the "markers" and do not have a refference here.

Tuned into 3.941 last nite per a tip via
an e-mail from a SWL. I was expecting a couple
of farts to be duking it out or something else
lame and ham-mish. Instead, there it was!!
THE PORKBUTT SONG bein played at a room filling
15dB-over-S9! The cherry on the cake was an
occasional drop-in of an echo-chamber which
only enhanced the "aye..aye...ayeeee" More listening
seems to indicate that there has been a radio war
going on for a bit between a group on 3.941 and 3.945
Yes folks, it looks like this is a spot that holds much
potential radio fun SWL'ing. Enjoy (..ya've earned it!)

From the FAQ article Repair Tips: Radio Shack Scanners, located
at:

ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner/Repair_Tips_for_Radio_Shack_Scanner_Radios

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables,
e.g., PRO-39 and PRO-43, can become unreliable after
prolonged use. The best repair is to replace the rubber
keypad instead of trying to restore contacts using
chemicals. A replacement rubber keypad (PRO-43 keypad is
RSU#10789808) may be ordered inexpensively through Tandy
National Parts or your local Radio Shack Store.

Mike Theriault wrote:

well it looks like their time is coming, it seems uncle is busy in the enforcement mode again. riley is on his white horse riding to the rescue. what is interesting is how they catch people jamming and whatnot, even though they are mobile. to me, it is really silly how much of the fcc's time is spent investigating reports of exams being fixed or sold, or whatever and rampant cheating . good grief, is it really necessary to cheat on a damn no code test? give me a break, boy these people must be real crackerheads. oh well, this is the face of the new ham radio band. come on in boys the water is hot, its been this way on the 11 meter band for 30 years or so, but you all already know that , but at least we admit it,.....cd is out....

Big 10-4 on that. I agree Uniden is better. In order to get a radio
from Uniden with both PL (CTCSS) and DPL you'll have to wait for the
BC780XLT unless a non trunking handheld SC200 will do the trick for
you.

I will bring you one back from England
I am going back next week and have access to Yupiteru and AOR, Icom and Yaesu.
I will be returning back to the US in 3 weeks time and I can accept Credit cards
There,,, all your questions answered.

I would prefer you e-mailed me instead of having an open discussion on a news group which would probably involve credit card details.

Best Regards
Martyn

HI,

Buy this Yupi or an AOR AR 8000. Both very good scanners. The Yupi is easier
to use.

I bought my third Yupi last week.

Greetings,

Roald

Are you using the "rubber duck" antenna that came with it or are
you using an outside antenna?

Hi,
Is there an On-line store for buying a scanner from Canada? I
heard they don't have the same rules regarding cellular phone calls that
the U.S. has. Is this true?
Thanks

Pamela:

Yes, that is true, however, it is illegal to import a "non-blocked" scanner into the U.S. A lot of people do it, and get away with it, but it's illegal just the same. There have been incidents where it gets held at customs...then you're stuck. Not recommended.

Sorry for the off topic question. If I have a cell phone that has been deactivated and will no longer dial normal telephone numbers, can I still dial 911 on it? I have heard that all cell phones (that are charged of course) active or deactivated can dial 911. Are there any other numbers they can dial such as those *SP or *TV8?

It depends a lot on what frequencies you want to monitor. The stock antenna on the PRO-43 is not bad, but it's not great. If you monitor the lower frequencies, i.e.; 40~150MHz areas, a longer antenna will definitely improve reception! Radio Shack & Grove Enterprises, sell telescoping antennas that do a good job.

Alright, there are several things you need to check.

1) If you are using an external power supply, unplug it from the scanner and use fresh batteries. If this helps you need to replace the power supply.

2) Unplug your scanner from the coax. Use the original antenna conneced directly to the scanner. Take it outside and observe the performance. If it is better, there is a problem with the coax, connectors or antenna.

3) If it is easy to get access to your antenna, take it down and hook a short piece of coax between the antenna and scanner. If it works better, you have a coax or connector problem.

4) Try replacing both connectors on the coax. They may have come loose.

5) Last resort may be the coax. If it became kinked, it could be causing problems.

Randy

I have found a very good article by Rich Wells, N2MCA on scanner antennas. He puts several through a very thorough test.

The three scanner antennas from Radio Shack did quite well...Even the little $19 one! Here is the link:

Also, if you didn`t seal up the connector outdoors, you could have water
leaking into the coax, which will degrade performance.

Dave:

I owned a couple IC-R2's. Performance is excellent...even better than many larger, more expensive scanners! Programming is a little different from the Uniden/Radio Shack types, and takes some getting used to, but it grows on you. I'm not sure if the R2 can be computer controlled, or just programmed. My experience using a computer with the R2, was for loading frequencies.

The exemptions are within Title 18 of the United States Code, Sections 2510 through 2520 of which are the Electronic Communications Privacy Act. In a nutshell, the exemptions are for police and cellular service providers.

I carry a VHF radio and have the following list of frequencies
programmed when I go to Rainier. I'm not sure which freq is for what
purpose, I scan them. I generally get traffic stops and backcountry
rangers, but not much from climbing rangers. They may have a different
freq which I am not aware of.

Tain't nothing in the header indicating that rec...swap is even in there.
The original troller sure got every thing in the UK though.
And I can hit reply which will go e-mail, or reply group. I do not have the
luxury of editing who gets it unless I create a new post.

I've only seen it on equipment and we are certainly talking about equipment,
or coax was equipment last time I checked.

My fraile, slight, oily tattood body is brought down to a cellar and stripped. I am then lain on a susspended board and wrapped tightely in rubber strips and commercial grade plastic wrap. Then duct tape and then chains and cords.

In this filty cellar, encased, sweating profucly in my tight bosdy wrap I can hear a party going on upstair, probobly all tops and doms. playing with their subs.

Someone tears two holes with something sharp over my chest above each nipple. Each nipple forces itelf out with the pressure of the surrounding wrap. My tits stick out at least an inch. I feel searing heat. like oil or wax being poured on each one. Not dripped, but poured as if it was from a hot panoff the stove. The wax is hotter than normal. I squirm from the sear....the wax is then beated off with a bamboo stick then the process is repeated. Suction cups are then applied to my sore nips and Im left alone for about a half hour.

I fell the cups yanked off and my nips feel the cold air. They must be 2 and a half inches sticking out into the damp musky air.

I hear a voice. "Now we begin" "open that took chest and that tool cabinate and give my a rubber apron.

It does begin. Over the next 3 hours my nipples are subjected to brutal floggin repeated by poured hot wax. Cigarette and cigar burns, tourches and fire, insects and piercing clamps with chains, copper wires that are wrapped around the sucked nibs and heated. Vice grips from a boiling vat of motor oil, cactus that are cut from their pots and suspended upsidedown with eyehooks and bungees boucing on my tits for an hour at a time....as the s&m party continues on upstairs.

This is just one of my fantasies. Im looking for a top (pref, a gay guym into gay sex) who is interested in experimentin with a guy who's notafraid of scars (perm damage yeahm but I like scars) also into POW interogation scenes, torture since I was a little kid, turned me on. Im a very young looking 40. Military buzzed head, tattoos.
Looking for a Dom who is experienced, who just wants to play. I live near Tampa Bay, Florida but travel freq, and go just abouteverywhere. Freq. the west coast, (LA, Vancouver and NYC on biz). Ill be in Canada this week.

now I could be 100% wrong here .. but this is my best guess.
I think that if you get a whip antenna and crop it to the correct length for the freq range you want
Ie .. maybe choose the center of it , I *think* that means that the antenna will resonate at a freq close to what you want.
Again I could be wrong.

3 hours - tied naked to a chair with hands cuffed behind my back. Gagged
with a ballgag and eyes closed with duct tape. My ankles were bound with
leather belts. My tits were tortured with ice cubes and pinched with
steel clamps. My clitoris was also rubbed with ice cubes and pinched
with a steel clamp. This went on for over one hour before I was hung
from a beam with my arms above my head. I was standing on the tips of my
red panted toes. My ankles have now been cuffed together tightly and toe
cuffs have been applied to my big toes. I was whipped for almost another
hour and spanked really hard with a wooden paddle. My pussy was finger
and licked and even bitten. Ice water was pushed inside my pussy until I
began to cramp and piss the floor. I was paddled even harder after this.
The final hour I was cuffed belly down and spreadeagle to the old steel
bed in the basement. I was fucked both in my pussy and ass. I also was
forced to give my captor a blowjob and let him cum in my mouth. A belt
was then fastened tightly around my neck as he forced me to swallow his
cum. I was then choked until I passed out.

You are confirming what I had already heard. I was just hoping there
was new and more hopeful news on this subject!

> Everybody else is asking questions, you seem to have the answers.
> Please post any info you have!

I have a lot of info on the new fire net. The law net info is pretty
useless, since there is nothing you can monitor that you can
understand. It will take me some time to type up the useful fire net
info, so I will post that, probably this weekend.

Yup. Or, get a highpass filter. The second stub is to counteract the reactance of the first at the desired signal's frequency. But it ends up placing a tapped coaxial resonator across the feedline, which will peak that range, but lower others.

The best way to handle this is the way I do. I block the sender by highlighting the offensive post and choosing "Message" / "Block Sender" and then choosing the "Yes" button when the prompt asks if I want all of the messages from that sender removed. In this way, no one using my computer will ever find another message from the offensive sender again. If others post comments, and leave the offensive post as a trailer, I consider blocking them, too, unless it seems like a one time mistake. This keeps my mailbox very nice and clean.

Another thing that helps is to pay attention to the groups that the
message is crossposted to. If you respond, post only to your own
group. That way the message is not propagated back to the original
sender. In this case, the original post was a forgery posted by a
Troll. They live for the shocked responses. Normally, if they get no
response, they go away. I have snipped a few of the crossposted groups.
Thanks.

When I was at Camp Edwards (also serves as USCG Air Station and Otis
AFB) in Massachusetts a couple years ago, I visited the "antenna farm"
and recall seeing some darn impressive (in length and complexity)
antennae, some dipoles that must have been close to 200 feet per side.
I would guess those are used for naval comms......
I will ne down there again in just a few weeks, I will have to take
a peek.

Source record: 86914

I bought one a few months ago...and it was a very pleasent surprise. Has outstanding audio for its small size...and really good sensitivity.

Lack of size of course means a lack of buttons & control knobs...so to program the unit requires lots of sub-menues, but before long its second nature. All-in-all a killer radio!

As far as interference to the scanner when it is operated near a computer system...i have used mine near (setting on the computers tower in fact) a 233mhz computer (60-66 mhz bus system) with no problems. Newer computers with a faster 100 or 200 mhz bus system might cause some interference...but i have never tried my R2 near one so i do not know.

But even if yes...i would still get the radio, as it is a really neat and unique little system. Don't let its small size fool you...this little scanner packs big-time punch! Fun to play with!

Yeah, might even be a killer app for perverts. But unsavory applications aside, you can also tune into ham FSTV stations, traffic cameras, and those "rabbit" boxes you connect to a VCR or DVD player to broadcast the signal to other TVs in your house. Heck, if you connected this thing to your PC's video input card, you'd have a no-lens webcam. This thing sorta' amounts to a WatchMan on steroids.

How close are you to the airport? And what _are_ you using for an
antenna? Seriously, are you hearing tower controllers, en-route
controllers, or actual aircraft? You can tell by what they say.

I agree about staying away from the radio shack - uniden is the way to go. The 780 sounds like it will be nice when it comes out. If you want to buy right now, I would suggest the BC760XLT and make sure you buy the CTCSS board. The board is easy to install, the radio is easy to program, and the sensitivity is excellent (especially with a good antenna).

If the laws prevent you adding a big antenna onto the roof, take a look at this antenna.
http://www.garlic.com/~m4bz/ventenna.htm
Its the Ventenna, which is a special antenna for both scanners and ham radio that slips over the stink pipe on any house. Its very discreet and no one will know you have it installed. I am unaware of where to get these in Australia, but importing one from the US will probably be cheaper anyway and tax free!).
If this is no good, go for the whip antenna tuned to the frequencies you are after. I believe Dick Smith sell a whip antenna kit with a cutting chart so you can cut the antenna lenth to suit the frequency you want to listen to.

Cheers

Message-ID: <sjujd8nrh5189@corp.supernews.com>
Source record: 86970
Cross-posted to: rec.radio.scanner,rec.radio.amateur.antenna

I bought a telescopic antenna from RS to replace the stock rubber duck for my BC245 a while ago, and for some reason it seems to fit loosely. Reception is good, but in the car especially, with the antenna up higher, the bouncing makes reception _very_ choppy; much more noticeable in the Air band. If I reach over and hold the antenna still, reception is good.

How could I fix this? I thought about maybe soldering a tiny bit on the inside of the BNC plug to maintain the ground, but this seems imperfect. Any better ideas? Thanks in advance.

Try a jumper wire between the grounded side of the BNC antenna connector,
and the ground side of the headphone jack. That worked on earlier models of
Uniden scanners. They have a resistor built in, to protect your hearing.

Actually, I just saw that model last week. Another person in the rec.radio.amateur.antenna newsgroup told me about it. How big is that? Do you have a problem with overload? My rig has two attenuators, 10dbB, and 20dB, and I can combine them into 30dB, so it shouldn't be a problem. Do you have yours on a rotor, or dedicated to a particular direction?

Thanks,
Bill Crocker

Would this be a case of the police using their radios to break the law?

Miami Cops Criticized in Elian Raid

MIAMI (AP) _ City police officers created obstacles for federal agents planning to seize 6-year-old Elian Gonzalez and were considered a risk to the operation, according to an Immigration and Naturalization Service official.

Miami police were deemed an ``assessed risk´´ when INS agents stormed the home of Elian´s Miami relatives on April 22, according to an INS memo described in Wednesday´s Miami Herald.

The May 4 report to INS headquarters from Robert Wallis, the agency's district director, said Miami police once used emergency lights and radios to alert Elian supporters that federal agents were in the six-block barricaded area surrounding Elian's home.

Law Enforcement Professionals: SAVE ON LONG DISTANCE TODAY!!!

Nope. Just wondering if there is anything better than the telescoping antenna from Radio Shack.

Also, the local police/fire depts around me are all on trunk systems. What is the best position of the telescoping antenna should I use? Should I fully extend the antenna? Or should I leave the bottom half collapsed?

thanks!

4141. Suffolk County LI PD VHF Freqs Dropped?

Newsgroup: rec.radio.scanner
Date: 2000-06-08 00:00:00 UTC
From: Art Harris <n2ah@my-deja.com>
Message-ID: <8ho9i5uvo1@nnrp1.deja.com>
Source record: 86982

After the Suffolk County (Long Island) PD went to a 800 MHz trunked system some years back, they continued to "simulcast" on their old 155 MHz freqs. Lately I've noticed that some Precincts (e.g., the 4th Pct on 155.910 MHz) have gone quiet, while others (e.g., 2nd pct on 154.845 MHz) are still simulcasting on VHF.

Anyone know why? Has the 4th Pct moved to a different VHF freq?

Any time electrons flow in unison there is some electronic
disturbance that results. Anything that moves in an electric field
generates a magnetic field and any conductor that moves in a magnetic
field generates an electric current. Any field may be a disturbance to
any other fields anywhere....even in left field... even in miscelaneous.
When the Ham population signifiently increases or decreases it can
be a reason to post about it in rec.radio.amateur.misc. It is well
withing the field of such a category since it signifies a probable
disturbance to the total basis and purpose of amateur radio...just as
much as a gigantic solar flare. There sure will be some miscellaneous
effects involved!
People who believe that electricity flows from + to - use the right
hand rule. People who believe that electricity flows from - to + use
the left hand rule. Let me put another twist on the subject. People
who believe that Ham Radio is not a technical hobby are trying to make
up their own dumbed down rules which can cause such a disturbance that
hams will flow away from the hobby and non-hams will be so repelled as
to never consider becoming hams.
This is my unified field theory. I'm just a ham. I don't promote any
hand rules but sometimes I think we need to signal that uses some
finger rules. I dunno if they will only include thumbs up. Surely
some concepts recently enacted call for other miscelaneous finger
gestures.

Hams need MORE license classes,

Good advice as this problem is undoubtedly due to poor image rejection
in the scanner. An alternative would be to get a scanner like the
PRO-2006 that uses a high first IF (around 600 MHz.)

I have used the shorted 1/2-wave stub approach (connected through a BNC
"T" connector at the antenna port). It works OK, but will reduce signals
outside the aircraft band somewhat as well due to it's relatively low
"Q". It will also attenuate signals on harmonics of its design
frequency. The low pass filter is fine if he's not interested in low
band VHF listening.

Bill,

It has a 12 foot boom, 30 elements the longest being 12 feet and it
has an 8 foot turning radius. It is on a rotator. No overload problem, but I
have only used it with my Icom R7000, which would be near impossible to
overload and, a Yaesu 847 transciever. I bought it for Ham use so it is
mounted horizonal. It's TV and FM radio reception is GREAT!

Glenn

The problem with the ULF is not encryption but low bandwidth.
They normally use very short codes, i.e. one, two or three letters
to tell a sub to raise the radio mast and get the real traffic on
satcom.

If they are doing it right, there will be dummy traffic all the time
so that an enemy cannot tell simply by the sudden appearance of traffic
that something is going on.

With the terrible security in our country I would not be sure of them
doing it right but the Navy and particularly the sub service were better
at security than most.

You're never gonna believe this, but...
When you ship it late
It'll still be late when I get it there...

Since experts agree (and savvy users know) that Microsoft's products are not superior to those offered by others, these outsized rates of profit are proof of Microsoft's market stranglehold, and the best measure of how profoundly consumers have been overcharged, even as technological advances have driven prices down generally.

OK, just a question....
are strongsignals.net and strongsignals.com from the same people?

I'll believe it when I see it. No doubt the technology exists, but my guess is
that the lawyers and the government regulators will keep this animal caged up
for several years.

I hear some conversations on the cordless 900 area.My question is that
some of the conversations sound like they are a freq or two off center.I
can make out convo but if they talk loud or hard it breaks up.
My scanner is a 2032 and jumps 12 steps each time I switch freq.
Any ideas on how to clear it up or is it just the phone technology
today on 900's?

Try some other BNC connectors on the radio, just in case the RS item was a bit
off-spec.
Barrel too wide? Center pin too small?
Visit a nearby hamfest and try other antennas and see how they fit.

On our ambulances, we have a signal amplifier and a high gain cell antenna. When we need to make a call on our Nokia hand-held and can't get a good, signal, we just plug in the antenna on the back side of the phone. It is amazing how much stronger of a signal we get. For one thing, the antenna on the roof is in a better position. Also, it is a much higher gain antenna than the hand-held. Another is (I believe) 3 watts output. Despite all that, there are still many cellphone "dead" areas in our area.

As already stated, it can, but it is so darn slow for in the trunking mode if you try to scan both at the same time or two trunked systems at the same time. When in Sacramento, I had it set to scan both Sacramento City and County systems (both Mot Type II). It would sit quite for minutes, and then get the tail end of some transmission every once in a while. The same thing occurred when I tried using it in Oakland, scanning the City of Oakland's (EDACS) system and the Alameda County (Mot Type II) system. All of the systems worked pretty good if they were the only thing scanned.

NO. The distance covered is related to the inverse square law.
It will get you the square root of 5 times the distance (in other
words, a little more than twice the distance).

Ya know, I checked my old posting logs, and Mackey is correct! So, it has only been FOUR years that he has been annoying the hell out of this news group. My apologies to everyone for my mistake on the timing.

> I am also the faculty of a school for
higher
> education
> where people earn advanced degrees after high school or other
colleges.

He's THE faculty? Must be a small school! I wonder by what agency/agencies is this school accredited? I wonder if it has a web site as most institutions of higher learning do? That, I'd like to see.

> It sounds like you should try to learn something about real life
rather than
> only knowing
> the intellectual education system.

Oh, I can assure everyone here that I know plenty about real life. Certainly, I know enough to know that Mackey is not a normal person. I also know enough to know that the best way to deal with him is to simply ignore him. But I figured what the heck, I'll just have a bit of fun trying to push his buttons. Problem is that most of his buttons don't work, so pushing them does no good! He just keeps coming back with the same ol' stuff!

Anyway, since I will soon lose access to my student/alumni account, and probably won't bother to go with a commercial ISP (and certainly won't abuse my employers' access with this trivial nonsense) I thought I'd say g'bye to everyone who has made the last four years in R.R.S interesting.

To Mackey's worst enemy, Bill Cheek. Bill, if you're out there still, best wishes with your health and legal problems. To Richard Kendrick, if you're still there, thanks for the laughs. I particularly enjoyed your "Tale of the Bard of Mackey" a couple of years ago. I wish I had saved it! To Phil and Bud, and everyone else who finally gave up - hey, you guys are the real winners. Any other (as Mackey calls you guys) "Cheeks-a-likes" I'm missing? Gee, funny thing is that MOST people are "Cheeks-a-likes" to Mackey! Guess he never figured out that with that ratio, he must be the odd one.

Hey, is Michael Alexander still in this NG? Mike, you kinda seemed to be a jerk at first, but when you realized what Mackey was all about, you turned out to be a good guy, too.

And everyone, please remember. Be nice to Mackey and help him through his "special problem." He can't help it that he is what he is.

Another scanner that has CTCSS (PL) is the Uniden BC895XLT. I use that in my bedroom. Thank goodness for PL tones. I really wished my hand-held radio could do PL's.... I have a BC245XLT hand-held which I use in my car or when mobile.

Here are some REALLY good reasons for having CTCSS decoder built in...

Near where I live, 155.100 MHz is used by 3 neighboring counties... It is NAPA 11, MARIN 17 and Sonoma's CONTROL 9. I live in Napa County, working with a Napa County ambulance... I want to hear NAPA 11 but could care less about a Marin County ambulance requesting an ALS ring-down with Kaiser Terra Linda. So I want to add a CTCSS tone of 131.8Hz so all I hear is NAPA 11, which is what we use for EMS coordination or get updated info from the 911 operator. Also, our ambulance company dispatch is on 154.515 MHz, the same frequency as Burger King and In and Out Burger in Napa. I could care less about what somebody wants on their hamburger, I want to know what is going on with our ambulance company, so I put 131.8 Hz in as the PL tone.... it seams in Napa County, 131.8 Hz is the most common public safety PL used... all except St. Helena and Calistoga. From my house, with my good base-station antenna, I can pick up both St. Helena Police and Rio Vista Police on 155.520 MHz, so I program in the PL for St. Helena, because it is more relevant to me and I don't want the noise poluition of the weaker Rio Vista signal. Unfortunately, not everyone uses CTCSS tones... CDF only uses them for selecting repeaters but the repeater doesn't broadcast a tone.... So I often hear Sonoma-Lake-Napa West and a ranger unit around Madera on 151.460 MHz. I can't isolate just the Sonoma-Lake-Napa West channel.

4171. Re: Deactivated cell phone question

Newsgroup: rec.radio.scanner

During the Revolutionary War, the patriots fired many bullets in order to establish this once great country. Over the last 35 years, we as a people have slowly become accustomed to our disappearing rights as citizens. No longer can the "American Dream" be achieved by hard work and honest dealings. Minorities including WORTHLESS NON HUMAN ILLEGAL SPICKS are now favored - Affirmative Action programs are now the law of the land! Billions of dollars are given to these minorities each year in the form of Special Scholarships, Job set asides, Educational Grants, Training Facilities and the list goes on and on! THERE ARE EVEN MULTIPLE LAYERS of government specifically formed to "MANAGE" these special programs, AT YOUR EXPENSE!

The Immigration Policy of the US is nothing more than a sham! Our cities are turning into war-zones - cesspools of crime and have Third World characteristics. Blacks and Latinos are welcomed into the United States with open arms. Meanwhile, the white citizens of Southern Africa and Zimbabwe are denied even the most basic of humane consideration. They are now being murdered and raped at an alarming rates! Oh, the media says only TWO farmers have been killed? Well if you take a look at this website, you'll see A LOT more than two, and we're told there are DOZENS more pictures on the way!

>cellphone "dead" areas in our area.

Apparently it's not unusual for a "rubber duck" antenna to have 10 dB
of loss compared to a metal cartop antenna. In addition, using a phone
inside a vehicle causes additional losses. So it's quite believable
that a good antenna on the roof could deliver 10-20 dB better signal
than a handheld phone's rubber antenna used inside the ambulance.
That's the same effect as having 10-100 times as much power on transmit,
AND it also provides the same advantage during receive.

The 5X power increase from an amplifier is also useful, but it's only
7dB, and only helps transmit, not receive.

Dave

Especially considering that ULF transmissions are usually so slow that they're more like "minutes per word" instead of the other way 'round. ;-)

> Would this be a case of the police using their radios to break the law?

It's a violation if they used radio receivers to intercept transmissions
by the federal agents that indicated they were on their way. If you SEE
a car with US Government tags -- or a big truck with FBI or US MARSHALLS
or whatnot heading there, and you report THAT on the radio, it's hardly
a violation.

I have a Bearcat 200XLT which I'm very happy with. I've had it over a dozen years and wouldn't trade it for anything. I'm looking for antenna recommendations for it. I would like to find a rubber ducky type if possible. If anyone has suggestions I would great appreciate it. BTW, I also have a RS 2006 which is awesome but I use the handheld due to the ease more. And no, the 2006 is not for sale. Thanks.

Could also be getting a bad solder joint from the bnc to the board in
the radio. I've had to resolder mine about 3 or 4 times. Changed the bnc
once as I wore the pins off and the antenna would fit loose. MK

It is especially if you want to follow trunked systems. Besides that it is
also a good general use scanner. I usually carry the BC245 and the
R-10 around with me.

A new keypad is a good investment,
I have replaced one before (wasn't that hard to do)
it is something a guru can handle
a keypad costs about $10
you can order the part at your local Radio Shack
the part is refered to as a "keytop"

Mike Theriault <mkt@quicklinks.on.ca> wrote in message

Ralph Brown <rb@bridgeport.net> writes:
>A handheld cell phone has 600 milliwatts power. A bag cell phone has 3
>watts power. Since 3 watts is five times as much wattage as 600
>milliwatts, does this mean the bag phone will carry five times as far?

No.

In "free space" with no obstructions, RF energy spreads out by the
inverse square law. At twice the distance, the received signal is 1/4
as strong. To get twice the operating range, you need 4 times the power
(all other things being equal). So 5 times the power gets you 5^(1/2)
or about 2.2 times as much range.

But that only applies with no obstructions - say when you're on a hilltop
and the cell site you're talking to is also high enough to be in the clear.
In the usual urban environments, buildings and trees and such reduce
the strength of the signal much faster. Measurements show that signal
strength falls in proportion to approximately the 4th or 5th power of
distance, not the 2nd power as in free space. That means that to get
twice the range in the city, you need 16 or 32 times as much power!

So, in the city 5 times the power gets you somewhere between 5^(1/4)
and 5^(1/5) times the range - a factor of 1.38 to 1.5. Not such a large
difference, after all.

Dave

>I have used neoprene "O" rings to shim BNC/Telescopic antennas.
Go to your local hardware store, show the nice man behind the
plumbing counter the radio, and ask to look thru the O-rings.
I think it is about 1/2" in diam, and it was a real small [cross section]
O-ring. The O-ring goes on first then the antenna, the O-ring takes up the
slack at the bottom. I hope this made sense. Have not had my caffine yet!

Glad to hear this Mark. This is the first time in my 30 years of public
safety monitoring, that I am unable to listen to my local PD because of
digital trunking. I can see that the original prices will be steep, but i'm
sure that they will go down in time.

Chris

I used to have trouble with the crystal scanners, and the first synthesized scanners getting intermod from the commercial planes themselves as they were in my area. Didn't last long, but could be irratating at times. It would be worse at different times of the year, so I would disconnect the antenna, and use a little telescopic until things got better. Now, with all the new eqipment, I only have to tolerate those damned pagers down the road... Again, it changes with the season, and this is new stuff.

Few climbers own a VHF radio. A 2-way programmable unit is not cheap. A CB is much cheaper. In Canada where it is common to fly into huts by helicopter in winter the VHF is much more useful, and at least one hut requires the group to take one. They can be rented in that area. But Denali is heavily climbed - that would be a lot of rentals.

Also, there may not be many VHF repeaters in the Denali area, limiting the range of these units.

I only acquired the VHF relatively recently after climbing for almost 20 years. And really only because I now guide others.

Jim

I have the same telescopic whip from RS, and it rocks a
little on both a PRO-91 and an old Bearcat - must be the
antenna itself, but I have no problem with reception
breaking up. A rubber O-ring, as suggested in another post,
should keep it from rocking, or maybe even a metal washer,
if you can find one of an appropriate size, or a small blob of
hot glue, but since I'm not experiencing breakup of the
signal, perhaps you DO have a loose connection from the
antenna to the circuit board as well. I recall reading about
someone replacing the stiff wire connecting the antenna
with a longer and more flexible piece of coax inside the
radio because he had to open the radio several times to
fix the connection. They put only the length of wire needed
to link the antenna to the board and not a micron more,
and if the antenna base is forced a little one way or another,
that's enough to damage the connection.

4239. Introduction to Speech

Newsgroup: rec.radio.scanner
Date: 2000-06-10 00:00:00 UTC
From: ctpds49@aol.com
Message-ID: <20000610113659.16232.00000178@ng-fz1.aol.com>
Source record: 86812

Speech Inversion is accomplished by mixing the speech spectrum
(typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some
audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz
constituting the speech inversion.

Um, that wouldn't be a CB.

What "911 calls" did you want to hear? The person calling the 911 number
or the dispatch of the call that came in via 911?

Don't forget that there are 50 ohm BNCs and 75 ohm BNCs. The centre pin
varies in diameter.

Adair,

I have used a mag mount Hustler scanner antenna. No problems at highway speeds and reception is excellent. I have also used a smaller NMO mount (magnetic mount but its only 1.5 inches in diameter). Again in spite of the size of the magnetic mount I have not had a problem at highway speeds. Reception though is not as good as the Hustler - particularly on VHF-LO.

4257. Scanner software for Uniden SC200?

Newsgroup: rec.radio.scanner
Date: 2000-06-10 00:00:00 UTC
From: Vee Hikle <bbetz@home.com>
Message-ID: <3941A94F.B391F0AA@home.com>
Source record: 86892
Cross-posted to: alt.radio.scanner,rec.radio.scanner,de.alt.radio-scanner

I just got a Uniden SC200. Checked out the download database hookup and got a set of freqs for my zip code.

But I thought that the software today would be able to come up on the PC and I could create, or share NASCAR files with others and then load them into the scanner with the names after I typed it all in. Is there anything like that out there that will work with the Uniden SC200?

Boy I thought with the technology today that this stuff would be alot better then calling a 900 number for police freqs!

Any help or suggestions are appreciated.

I checked this site out
http://www.strongsignals.net/htm/software.htm
but nothing is listed for the Uniden SC200. I have the serial cable, the com port checker software and that's about it.

Anyone know these? Specifically Troop J in Hattiesburg? Thanks

Also, my local police dept. doesn't appear in the FCC database. I saw them a few months ago before I had a scanner, but they aren't there anymore. Why not?

It is probably a VOR (VHF Omnidirectional Range) station. It's a navigation system used for instrument flying. It sends out 360 "radials". A receiver in the aircraft can determine which radial the aircraft is flying on. There's a needle which shows whether the aircraft is on, left, or right of the radial.

Irvine PD switched over in April. Most of the others are still on the old
460 Mhz system but will be switching over sometime this year. I don't know
if fire is or will be using the new system.

When you get them on the net for around $100, it's a good scanner. You get a PC port, the program, Percon (ok, the 1998 version), and mil air scanning. Not a bad deal. The scanner has a very annoying squelch problem. The time constant is too short. The radio is a pain in the butt to program by hand, but very simple with the PC. I have created lists using Excel with some hand editing.

I took mine on a recent Las Vegas/Area51 trip. I found an unlisted air freq (300.1MHz AM) for the TTR (Tonopah Test Range) using the UHF service scan button. The service mode scans are great.

So the answer is it is good for the right price.

Adair,

I haveused a number of magmount anttenas and they have all fallen off at speeds in excess of 75mph. I have a truck so maybe it is the areodynamics of my truck vs a car. I'm also interested in a Cell look alike as it is also more accepted as normal and stealth is an issue for me.

You can program the contents of every memory, and many if not all of the
operating modes, using a computer. But you can't control the receiver
in real time.

Source record: 86833

Bill,
I've been using the Icom software for my 8500 and it works better than any of the other programs when it is used for only controlling the radio. It is not as good at file operations with almost everything else being better! I have purchased several of the more popular programs and they all have different ways of doing about the same thing. My main complaint about all of them is the lack of scanning speed! My unmodified radio will only scan at about 8 channels / SEC without missing calls. Without external control, it is 5 times as fast! Maybe someone has overcome this problem, but I haven't seen it. It is a great radio, but not as a fast scanner under external control.
I am using a pentium 60 MHz with mine and don't know what a faster machine would do.

I personally use the Radio Shack mag mount mobile scanner antenna. I have my Trunk Tracker scanner and an old Regency receiver pluged into the antenna and it works fine for local listening (police, fire, etc..). The antenna is in my basement, where my radio equipment is, and it sits on top of a small 3 amp power supply..

Don't put the thing up on a pedestal. It is still an amateur receiver.

And it is a receiver, not a scanner. Radio Shack sells better
equipment, if you want a scanner.

It is difficult to service as no extender boards or cables ever were
available, you have to tear everything apart to get to anything, and
the service manual assumes you are reading the mind of the Japanese
engineers who designed the thing. You can't buy a failed component;
you have to buy an entire $$$ module. The CRTs are long obsolete, and
they go bad with age as well as hours of operation, so all most of the
things by now need a $800 CRT module, and even those won't be
available much longer. Keep that in mind if you are thinking of buying
one used.

It's a receiver with a video game on the front panel.

A far better as well as cheaper investment would be an R8500 with an
add on signal monitor such as the Atlantic Electronics SM-1071 sold by
CSE Associates www.cse-assoc.com.

We sold many many of these receivers in our day as ICOM dealers, and I
tried hard to talk customers out of them. Only customers were the
government, and the failure rate of the R9000 was substantially higher
than R8500. I regularly visit customers who used to buy ICOM receivers
in large quantities, and the R9000 is the one you see out of service
the most. R7100 is next worst. R8500 and R7000 have been the most
reliable.

Those large government customers switched to real receivers by Watkins
Johnson.

4287. Re: Amateurs must be stupid if ham radio is to survive.

Newsgroup: rec.radio.scanner
Date: 2000-06-13 00:00:00 UTC
From: Mark Holden <msholden@ct2.nai.net>
Message-ID: <394687C6.6B7C9E36@ct2.nai.net>
Source record: 86695
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.scanner,rec.radio.shortwave

A reason ham radio is declining is learning the code, and putting together a station is hard work compared to the ease of buying a computer and joining an internet chat room.

In some respects, the code is like learning a foreign language, and even though there are only a few dozen characters, somepeopleseemtosendcomletesentenceswithoutspacessoifyoumissaletteritmightbehardtofigureoutwheretopickitupagain.
O th er p e op leputp aus es in th e wro ngpl aces,m akingi t toughert o figu reo ut lettersyo umis s e d.

Some people are just better than others at learning languages.

While a no code license exists, it's more limited, and holders of that class of license seem to be looked at as second class citizens by some hams.

I don't think the theory is as much of a deterrent because people who are interested in ham radio are often interested in experimenting. They see a use for it.

Perhaps a compromise could be worked out so people who didn't want to learn the code would need to show greater understanding of theory for a given class of license.

But until the folks who earned their licenses the hard way decide the code is less important than getting more people involved in the hobby, little will change.

It doesn't matter how far you can send a message with 1 watt if nobody is listening.

Yeah, but they only "allow" 75 mph... I'm sure you could find antennas that can
last more than that.. I had one CB antenna stayed on until I reached around
90... had to pull over and stick it back on after that. :)

I don't know the brand of my antenna, it's not marked on it but it has held well at speed. I took it to Arizona where the speed limit was often 75 but any sort of gust at all could have put it above 85 (assuming head wind). I always wipe down the roof where I put it, I figure the dust could "lubricate" it, slightly.

The post is begging the question. Just because standards change to attract new operators, it does not follow that the new lot of operators are less intelligent and needed the chage in standards to pass the ham tests as they were.

There are many competing forms of communication that appeal to the pool of potential hams. Change may draw some into the hobby who otherwise would not take a second look.

Kindly stop posting this garbage to rec.radio.shortwave. Most of us here are SWL's and don't want to listen to a couple so-called HAM operators get ugly and attack one another (why not do it over the airwaves?).

Have some consideration for someone besides yourselves and *PLEASE* remove rec.radio.shortwave from your headers when replying.

THANK YOU VERY MUCH FOR YOUR CONSIDERATION,

Tim

I agree and emphasize the point that it shouldn't be your only radio.
I consider it a small jack of most trades, a "dingy". Sometimes I just use it
to see what's hot on the shortwave bands before I tune another more selective rig.
Lately, I had interference due to a local ham on my AM and SW bands. It was
allot easier to find out what band he was on with the R2, and then tune my
RS DX-398 on 20 meters to hear him on SSB.
I am very pleased with the rig, but I wouldn't call the audio excellent, due to the small
speaker.
I also use it for AM broadcast listening, and a telescopic whip really helps.
I have also noticed that it's intermod rejection is much better than other multi-band
amateur radio
handi talkies.

4300. Re: Still Looking For Help with A BC245XLT

Newsgroup: rec.radio.scanner
Date: 2000-06-13 00:00:00 UTC
From: Michael Kellogg <Michael@kelloggs.org>
Message-ID: <skdh6aegis4167@corp.supernews.com>
Source record: 86708

Jeff,

I can't imagine why you're having this problem. I've never had anything remotely close to that happen to my BC245.

On a protocol note, it's generally not real polite to keep posting the exact same message 2 and 3 times in the same newsgroup. Your original post garnered like half a dozen replies, then you posted the same (as new) question again less than 3 hours later, and now you've posted it again after one more day. Give your original post time to be read by everyone. I'm still getting responses to posts I made many months ago.

From: terry@weatherford.org
Message-ID: <ske1h4ieis4173@corp.supernews.com>
Source record: 86711

Hello,
I have a Pro-75 (handheld scanner) and a HTX-242 (2m mobile ham) both in my vehicle. I use them both to scan frequencies, many of them are the frequencies are in both. Both are on separate antennas. Both are plugged into the same cigarette lighter. Whenever my HTX-242 is stopped and a frequency (to monitor/talk, whatever), the Pro75 will stop on the frequency and make a small noise (does not do it when I take the antenna off). If I'm scanning, and both happen to be on the same channel at the same time, the same thing will happed.

Besides separating the units, does any one have any ideas what to do?

Thanks!

There are no roads in the US that I'm aware of that allows speeds in excess of 75 mph.. what are you doing driving that fast? :)

Most mag mount antennas will usually only rate themselves at 55 mph... even though many will stand more..

The best guide to Disneyland scanner frequencies is available as part of the Disneyland Information Guide.

The scanner frequency page (Direct Link: http://members.aol.com/alweho/docs/scan.htm) includes not only the trunked radio system, but also just about every other frequency concievable, including (but not limited to) show control headsets, wireless microphones, etc.

I used to have a blast listening to my scanner at Disneyland when I lived in Orange County. Now, however, I live a ways away.

> Since when is it illegal to listen to Cordless phones?

Usenet is the electronic proof of both Sturgeon's and Gresham's Laws.
The following is a re-post of a short disertation on the various laws and
their effect.

The laws of the United States, passed by Congress, are codified as the
United States Code (USC). It is divided into titles covering various subjects.
Title 18 includes the criminal laws and penalties; Title 47 covers
telecommunications. A law can be refered to by its original name (i.e. "The
Communication Act of 1934") or its entry in the USC. A specific section
would be refered to by title/USC/part/section, i.e. 47 USC 605.
To carry out the law, the various government agencies create regulations,
which are codified as the Code of Federal Regulations (CFR). It is likewise
divided into titles, with the FCC's rules in 47 CFR.

18 USC 119 bars the disclosure of any electronic communications to
which you are not a party (with certain legal exceptions), and sets the
penalties. 47 USC 605 (the Communications Act of 1934) also bans the
disclosure or use of third-party communications. With minor changes, this
has been the law for 60 years.

In 1986 Congress passed the Electronic Communications Privacy Act (the
ECPA), which added definitions to the law that banned listening to cellular
telephones. It also banned the monitoring of broadcast auxiliary, SCA and
scrambled signals.

In 1992 Congress passed the Telephone Disclosure and Dispute Resolution
Act (TDDRA), which instructed the FCC to ban the manufacture or import of
scanners capable of receiving cellular. In accordance with this law, the FCC
modified 47 CFR Parts 2 & 15, effective 26 April 1993. Note that this does
not affect the sale of such scanners, so long as they were made or imported
before the cutoff date. It also does not bar individuals from modifying
their receivers.

On 25 Oct 94, the Digital Telephony act was signed. Buried in one of the additional sections was a change to 18 USC 2510 & 2511 that added cordless phones to the original ECPA ban on receiving cellular.

In short:
It is illegal to manufacture or import cellular-capable scanners.
It is illegal to listen to cellular (and cordless) transmissions.
It is illegal to divulge any communication to which you are not a party.

4317. Orange County (CA) 800 FD update

Not quite true...

For those who listen to Orange County, CA, fire agencies, the info currently listed on all the websites I am familiar with is no longer completely accurate. For example, the Orange County Fire 800 MHz trunked system listed at http://www.latraffic.org/radioman/orange/ocfa.html is accurate, but incomplete. It only lists the freqs for the Orange County "Countywide" Cell group, and to listen to Costa Mesa and Santa Ana FDs, you now need to also program (into a separate bank) the following freqs for the South Cell group:

868.925
868.625
868.675
868.375
868.125
867.875
867.825
867.825
867.625
867.375
867.125
866.875
866.625
866.375
866.175
866.125

Note that the above frequencies are shared with the new law enforcement net digital system, and so you will need to lock out about 30 undiscernable digital talkgroups to narrow it down just to the analog

talk groups used by Costa Mesa and Santa Ana FDs. Not much different than the approx 50 law digital talkgroups you now have to lock out of the CountyWide Cell group to listen to all the rest of the FD analog talkgroups.

Now that the digital and *encrypted* law net is online and agencies are switching over in phases (if things go as scheduled, by the end of the year 460 MHz will go completely silent for law in Orange County, CA), there are 5 regional cell systems plus the countywide cell system: North, Northwest, South, Southwest, Laguna and CountyWide. Each cell consists of many talkgroups that are either agency specific or shared. The fire talkgroups have all their normally used dispatch and tac talkgroups on Countywide cell or South cell (in the case of Santa Ana and Costa Mesa). However, all fire agencies also have the capability of using multiagency talkgroups that are located on all six cells. These talkgroups will rarely be used, but will allow PDs and FDs and other agencies like lifeguard to interface during major emergencies, such as an earthquake.

(Hopefully, now that I have posted this info, all those websites will be updated soon!)

Mike

This is very interesting Mr Mulligan,

Then it is very easy to legally circumvent the law from
design level.. Just manufacture the scanner, so it is
easy to (modify). Then if the hidden purpose of the
makers is to bring this capability.. It will still hit their
marketing target. People who want to listen to all
frequencies will find the information, and get the right
device... You got me interested.. :)

The technology is there and already used by Big Brother.

The only part of this law I would agree with is:
' It is illegal to divulge any communication to which you are not a party. '

Then, I would make it even less intimidating, by allowing to divulge
any information that were not known to be potentially harmful to others.
... One example, is that if Scanning, you find Mr.XXX is cheating on
his wife.. You would obviously be found guilty, if you were to divulge.

But divulging the wife's secret chicken receipt, would not hold in court.
Unless they are a bunch of coocoos, of course ;-)

Regards,
-Ben

The VHF side of the system is prone to much outside interference, which ends up being
simulcast on the 800 side. When this happens, they pull the plug on the VHF until it calms down.
Hope this helps.

Only problem is, the FCC is not granting approval to any new radios that have the ability to be modified. That's why every new scanner takes so long to hit the shelf, i.e.; Icom IC-R3, and the new Uniden (can't recall the number). The FCC recently forced Icom to make changes in the design of the PCR-100, PCR-1000, IC-R10, and IC-R8500, so they could no longer be modified. If Icom did not comply, they would no longer be allowed in the U.S.

>
>what antennas do you use for shortwave and scanner listening.thank you very
>much.
Let the FLAME wars begin.
Such a simple, valid question, and so
many conflicting answers.
At home I use a old RatSahck(SM)
Diskcone for scanning. Works ok from
50 to 100, good for 100 up to above 1000.
For SW I use either a "long wire"
[ok really just a random wire about 60'
long], an experimental loop, and,
please don't laugh, my 10mtr 1/4 wave
vertical. I have had my wire antenna
fail 3 times this spring, a tree
took it out first, the support pole
at the other end rusted through, and
Sunday night the wire was on the
ground and I have not had a chance
to even look at it yet.
The 96" of vertical rod work much better
than I would have once thought!
I have even been known to use the
[oh horro of horrors] diskcone for
SW. Was not as good as either other
antenna, but it worked well enogh to
hear the BBC and a few other power houses.
And it beat getting my news from the television!
In the car I use a NMO mount Trunking antenna
that is about 17" long with a loading
coil [3 turns or the rod] in the middle.
IT works great for 100MHz+ scanning and
works with the 2mtr and 70cM ham gear
as well. And looks like a cell antena so
it attracts no unwanted attention.
You try explaining that roof full of antennas
to a small town cop in the hicks!

I use either the stock AM/BCB antenna,
or a 10 Mtr 1/4Wave vertical for SW.
But SW in a car is pretty much a bust.
Even IF [and that is a really,really big

IF] you clean up your own cars ignition,
gauge, wheel, alternator, CPU noise,
you will then hear evey other modern
vehical in a 1000' radius.
Sometimes, late at night, out on
back country roads SWL is do-able
in the car.
Standby for 50 FLAMES pointing out why
everything I do is wrong. Good luck
and welcome to the nut house!!!
In short, whatever works for you is GOOD!
YMWV

Oh, but you gotta understand Mackey's "special problem!" To him, any attention that you give him means that you like him!

Many people here have learned that the best way to deal with Mackey is to simply ignore him (that is what I meant when I mentioned "those who gave up" in an earlier message, and I certainly didn't mean to insinuate that they let Mackey get the best of them). I, too, usually just ignore him, and don't contribute to these inane threads.

Lately, though, I was missing out on the cheap entertainment to be had by (figuratively) smacking Mackey up-side the head and watching his reaction (which is usually something like "ohh, I got you good on that one"). You and I and most everyone else here know that Mackey is "unique." Problem is, Mackey himself doesn't realize he has that "special problem."

You're right! We need to substitute Latin for Morse. It too is a practically dead language, practiced only by hobbyists and religious sects, but Latin is far harder to learn than morse, ensuring not only empty spectrum but that everyone you meet is intelligent. We could have two classes, an entry level requiring only the ability to translate Ceasar's Gallic Wars, plus a "general" class for those who can speak and write Latin as proficiently as the Pope. Best of all, beginners would only be allowed to transmit Latin on UHF whilst those who'd demo'd papal proficiency would be allowed to QSO in English on any band! Sound like a plan?

You mean, like allowing people who don't sign their postings, use "handles"
like "inductive reactance" instead of real names and use fake email
addresses to become Hams?

Bandercom is good. Buy a SW receiver to pick up SW signals.
Nothing is as good as a designated SW receiver.
The Yup 9000 is a fine radio as is the 7100.

Good Luck!

Well stupid, if you didn't know, posting your straight e-mail address on the internet is not a good thing.
You might think its "Manly" and "the right thing to do" but you are subjecting yourself to spam programs
which explains why you keep getting junk mail and subscriptions to porn sites in your e-mail box.
Also, when you make a comment you are allowing people to respond by sending you e-mail.
Most people on the internet, don't deserve the toilet water they consume less deserve my e-mail address, less the right
to give their opinion in my sacred e-mail box.
Don't EVER knock people for not using their real e-mail address or using a handle. You have to as newsgroups are the EQ
of CB not HAM to begin with and you wouldn't give your personal info to CB'ers would you?

---------clipped----------

Why not? Everybody isn't out to 'get you', and for those few
who really think it's funny to 'subscribe' you to junk mail, etc,
there is a cure. It isn't the most simple thing in the world, but
it can be cured. And usually, 'that' person won't ever bother you
again. I say 'usually' because some people really are that stupid.

I have these plug in crystals (for Realistic scanners) for sale:
They are in the 48 mhz range.
Formula is: for Example (48.0033 x 3) + 10.7 = 154.710 and are a BOMAR
brand name.

154.620 Mhz QTY OF 9
154.710 Mhz " 8
167.730 " 10
169.465 " 6
162.850 " 3
154.01 " 1
$ 3.00 ea. or 4 for $10.00 plus shipping.

Thanks,
Greg

It's no wonder that you get hate mail when you start off calling people "stupid." Only cowards or people conducting themselves in a questionable manner have to hide their identity.

Emergency communications.
Normally around 172MHz.
There listed on one of the FAA sites.
Not normal communications.
That would be current as of 6 years ago.
Which office are you near?

Well, in a small eastern Kentucky berg, with my ham call on my car plate,
I spent 4 hours trying to explain to the lame brains just what a ham was, and
why I had all those antenna. Finally a KSP [Ky State Police] officer stopped
by and read them the riot act. I am convinced that had he not shown up, I was
going to spend at least a night, and most likley a weekend in the slammer.
I have never been back to that county[Perry], flame it every chance I get
and hope they rot in hell. A true joy came when one of the peace goons
was lost here in Lexington and asked me for directions. He did not remember
me, I suspect they have hassled many out of towners, but I sure remembered
him. I was not a nice forgiving person and bet that he never made it to
his destination!
If I never go back to Perry county Kentucky it will be 100 years too soon!
Small town cops tend to be underpaid, undertrained, and have egos the size of
a mountain. Get rid of the cops and Perry county is a nice place with
very friendly people, it is the cops that ruin it all.
Oh I had a copy on my ham license, a copy of a KSP memo explaining that hams
are imune from the state scanner law, and a nice attitude. Until they got
ugly. No physical abuse just a lot of threats.
I tend to treat people with respect and politness until they show that they
derserve something else.
I guess I am lucky that I turned off the SW that I was listening to,
otherwise they would have surly shot me for listening to "Radio Moscow". I
loved their programs, funniest thing outside of a 3 stooges movie!
[Sorry to any and all Russians, but I bet they found Radio Free Europe and

Voice of America just as funny]
Older and wiser.
And to any and all poilce officers that are offended by my discription,
you guys have a lot of bad apples in you basket, way more then the law of
averages would suggest. Here in Fayette county the last 3 or 4 sheriffs
have gone to the "Big House" for various financial irregularities. Andthe
Rampart divison of LA's finest should make good clena cops scream in outrage.
But until the good police stop "standing firm" with the slimy cops, all
police officers will suffer continued loss of respect. And what about those
poor women in central park this week, stripped fondled and the cops stood
there and did NOTHING. The ball is clearily in the police court,
they can shape up, kick out the scum, stop protecting the boarder line ones,
stop making excuses for plain bad acts, or loss what little respect they
have left.
YMWV

Hi Steve,
I agree with Edwin about RadioWorld and Durham Radio. You may also check Radio Shack. When they have items on sale, they are pretty hard to beat. Plus, needed accessories are right around the corner, regardless of where you are. I hope this helps...

Of course not. I have met hundreds of hams and the percentage of idiots is a lot smaller than in the general public, I would wager. Maybe I have just been lucky, but I have found that most hams are intelligent enough to offer an interesting conversation and are among the most giving and caring of people I have had the honor to know.

Even on this forum, the idiots are not a majority. :-)

You are absolutely correct or at least that is what most of the hams on usenet indirectly believe. They think the ARRL proposal and the FCC ruling were good for amateur radio. (Dumb down the standards! A service full of retard hams is better than a service full of smart ones.)

If anyone disagrees, then you should be able to support the following:

Step 1: No more automatic renewals. Individuals must retest and pass all elements required for their license class.

Step 2: The passing score for written exams should be 90%.

Step 3: Two code elements, 13 wpm for General and 20 wpm for extra.

Step 4: No-code license should be one year non-renewable.

There's a grain of a good idea in there. Retest every ham
every ten years and increase the passing grade requirement
one percentage point for every year he has been a ham until
he is required to score 100% after being a ham for 30 years.

>looking for freqs. in and around the Ramstein/Kaiserslautern area, US
>Military type. Thanks,
>John

Try scanning between 30 and 75 mhz. Most of the radios in tactical vehicles use those freqs. I would pay special attention to the lower part, particularly below 50 mhz, but they do go above that sometimes (bet you didn't know that ham was a secondary user on the 6m band!).. If they are using SINCGARS radios, you can't monitor those. I would also listen in the US Govt freqs around 140 and 170. They have HTs that can be programed in those ranges.

Hope that helps (ps: I was in the Army for 7 1/2 years, only got out a year ago...)

The moral of the amateur radio "licensed" operators is at it's lowest in three decades.

If your looking for the FCC to eliminate amateur radio licensing forget it. The hams across this great nation and world will not allow it to happen. Why don't just sit back, study the thoery, code and take the test like the rest of us.

Let's get real here. I got my ticket primarily for the public-service aspect of ham radio. I'm not interested in cw nor am I interested in contesting. The concept of spending umpteen thousands of dollars and countless hours just to get a signal report from someone in Zimbabwe is ridiculous as far as I'm concerned. I am *NOT* knocking those persuits for those who do like them; it's just not for me.

That said, I hold a no-code tech license. If it were necessary for me to learn 5wpm cw to get _any_ ham ticket, I would not have bothered, and instead I would probably have looked at REACT. I'm sure some of the old farts reading this are probably thinking that would be better, however let's remember that first and foremost, public service is what ham radio is about and it's why the FCC doesn't just go and grab all the bands for commercial purposes.

Ham radio has to keep up with the times. During it's heyday, if one wanted to be involved with electronics and communicate over vast distances, ham radio was the only way to go. Contacting someone in Zimbabwe was considered a "big deal" then. Now, with cheap long distance and the Internet, the public is no longer impressed, and may, in fact, think that anyone who would go to such trouble instead of just picking up a phone is foolish.

If you insist on making the entrance and renewal requirements of ham radio more difficult, there will soon be no new hams. All you have to do is look at the average age of the ham radio population to see that is exactly what's happening. It may already be too late to change that.

Something that was lost after awhile from what the original posting said.

Why was someone racing a police car? If the poster felt that the officer
was in the wrong, why didn't he
just get the vehicle's license plate, or equipment number (usually painted
on the rear of the vehicle or rear
window), note the date, time, location, etc, and relay this information to
the local police department?

Instead, by racing the police car, he definitely endangered others on the
highway, and, by not knowing the
officer's status, may have endangered an investigation.

Please use common sense and don't put others in danger. As the Texas Peace
Officer said, officers have
descretiion, within the bounds of state law and department policies, as to
how they are to use their equipment
and emergency equipment.

As for the above, remember, the officer has the right of law, as well as
weapons and
other officers to back him up, to arrest someone who threatens him.
Remember, there is an old saying, "You may beat the rap, but you won't beat
the ride."
Plus, your fingerprints will probably soon be on file in the Criminal
Records Divison of the State and
FBI.

Many officers have looooong memories. Most are professional, and will not
let personal
feelings get in the way of doing their jobs. But, they do have this
previous action in the
back of their minds, and some not as professional officers may harbor a
grudge and not
drive as fast as they can to get to your house (read this as driving faster
than the speed
limit). Or, they may arrive with lights and sirens on, as opposed to
arriving silent. The siren
is heard from blocks away, and instead of capturing the crook, he hears the
sirens and runs
away to burgle another day. Running silent enables the officers to surprise
many a crook and
capture them. So, how do you want your police to operate?

And, Some Doctors get away with botching surgeries. Some teachers can't
teach. If there are
bad apples, either report them to their department/supervisors, or shut up.

Now back to scanning.

For those of you who may be traveling through Waller County, TX, northwest
of Houston on US 290 or west of Houston on IH-10,
there is very little police traffic on Sheriff Primary 155.760. They are
now doing most of their dispatching on Nextel. Sorry, scanners.
So, please obey the speed laws in Waller County, you won't be able to find
the speed traps by listening to the Dispatcher.

Is the BC 895XLT modifiable ? Like getting it to have
continuous band coverage no gaps, I'll live without the cell band. My BC855
takes care of that !
Thanks !

Right around 3500 is where the cut off started. You might have to do the hardware mod? Then do the eeprom rewrite. There is even a cutoff for the hardware mod also and I'm not sure what serial number that is. The FCC made them put in a different eeprom. Good luck!

Hello John,

Hope you enjoy Ramstein as much as we did. Had two tours. Took in all the sights both TDY and on vacations. I last was there during the Gulf war. I know you have heard the good and the bad already. Unless the German govt. has changed things, most of the military freqs are 66mhz to 76 mhz. Aircraft's freqs are the same both VHF(118-136) and UHF 250-400). OSI and CID were around 38.00mhz. I will dig out my list. I have retired after 30 yrs, move from The Air Force Academy in Colorado Springs back to Georgia(hated to move back, but wanted to be near my mother). What type(s) of radios do you have. Will get back to you, if I am to slow email me.

Best of Luck
Keith-KA5QFI

I won't settle for anything less than the NCEE Electrical Engineer P.E.
exam for the Extra, with at least 30 wpm of code. (More is better isn't
it?) And, unlike professional engineer state licensing, LET'S MAKE EM
RETAKE EVERY 10 YEARS TO KEEP THEIR LICENSE. And, oh yeah, the State
P.E. passing grade is a paltry 75%, curved. Let's make sure we only get
the best of the best, and set passing at 100%.

In only a decade, the ham population of the U.S. should be maybe 2, or
3. Now, if they just had someone to talk to. I'm sure there's a few
JY1 types out there who didn't test at all, but just declared themselves

a ham.

It sounds tough, but one must prove their excellence to access a public airwave, shouldn't they? Just like broadcasters? :)

From: Larry Klodt <llklodt@home.com>
Message-ID: <ppB15.504$dF.18711@news1.rdc1.il.home.com>
Source record: 86719

I have for sale a Radio Shack PRO-2039 scanner which is in EXCELLENT CONDITION! This is a 200 channel base unit, double conversion so you can hear all the cell images, hyper scan and covers 30-54, 108-136.975, 137-174, 380-512, 806-823.9375, 851-868.9375, 896-960 mhz. This is a great scanner, and I am selling this due to the fact that I lost all my desk space with the purchase of my new Grundig Satellit 800 and that our county has gone to an EDACS system. I am asking $135 INCLUDING INSURED SHIPPING. THANKS!

LARRY :-)

Not me,
Your opinion is worth as much as the name you sign to it. I'm willing to sign my name to what I say, and stand up like a man for what I say. If you were signing your name you might not make rude, lewd, obnoxious, derogatory, specious comments. If I get spam, I report it to the IP, same with porn. And my email address, while valid, is not my working address. I'm not stupid, I have a free Juno email address for newsgroup posts. My postings are items I wouldn't have any problem saying on a radio to another Ham. I wonder, which is more representative of you, the way you talk on your ham rig, or the way you write on the Internet. I try to use manners both places, it's the way I was brought up.
BTW, I've read a lot more trash on the ham newsgroups that I ever heard on CB radio, and I've had one of those since 1970. This looks more like 14.313 than 27.185. And yes, I've given my personal info to Cbers, made some good friends that way.

Mark K5MAR (ex KDW-1411)
And proud of both.

Well stupid, if you didn't know, posting your straight e-mail address on the internet is not a good thing.
You might think its "Manly" and "the right thing to do" but you are subjecting yourself to spam programs
which explains why you keep getting junk mail and subscriptions to porn sites in your e-mail box.
Also, when you make a comment you are allowing people to respond by sending you e-mail.
Most people on the internet, don't deserve the toilet water they consume less deserve my e-mail address, less the right
to give their opinion in my sacred e-mail box.
Don't EVER knock people for not using their real e-mail address or using a handle. You have to as newsgroups are the EQ
of CB not HAM to begin with and you wouldn't give your personal info to CB'ers would you?

That doesn't say much for your company, Mark. What if prospective
customers do an internet search on you and see:

>Good. Get it reeeal hot, and then, shove it in your eye.

I sure wouldn't care to do business with a company president who
makes such hate-filled remarks, and would make sure others I know
avoid whatever it is you and your company does, if at all possible.

That's fine if you don't mind being leashed. You're helplessly dependent upon untold billions of dollars of computer equipment belonging to thousands of corporation, interconnected by millions of miles of cable, staffed by thousands of workers putting in tens of thousands of man-hours per day to keep that incredibly complex system running.

Hams, on the other hand, have no such dependence. It's the *only* communications medium in which any two operators anywhere in the world can communicate without using government or commercial communication services. Those same two operators don't even need to purchase commercially-built radios -- they can build their equipment themselves.

BTW, the prediction that ham radio is dying is older than you are: In "...1922 many radio magazines which had catered to the transmitting amateur swung away from him, one even so far as to run an editorial ... prophesying the end of amateur radio." (From Fifty Years of ARRL.)

Yes they have. Ocean City's trunk system is very easy to monitor. Been doing it on a PRO-94 and PRO-2052 scanners, both track the system perfectly.

I'm in Ocean City several times a week fishing and monitor all the time. I've added all the info with talk groups of the Ocean City system on my website. To go directly to the Ocean City info go to:
http://home.flash.net/~av8tor/radios/ocmdtrunkfreq.htm

Be sure to take a look at http://www.flash.net/~av8tor as well as that is the home page of RadiosOnLine where I have lots more scanner info.

>as well as scanning ploice etc.

Can't speak directly to the 9000, but I have a 7100 that I really like, and I regularly use the AOR 8200 MK II which I also hold in high esteem. Both of these are about adequate for most casual HF receiving, with the AOR having some distinct advantages over the older Yupi. Both of them outperform most "budget" shortwave receivers.

However, if you plan on doing a lot of shortwave listening, I agree with the others who have replied: get a receiver that is specifically adapted for the task at hand -- HF AM and SSB reception.

The Sony ICF-2010 is a classic standard; the Sangean ATS-909 (Radio Shack DX-398) is an adequate substitute with a whole lot more memory. In the shortwave arena, both of them outperform any of the DC-to-Light receivers that any mortal could afford to own.

Hi Mark,

I'm also a beginner like you, I have two suggestions.

1. Don't buy anything before you have read http://www.strongsignals.net
from back to front. This site got me up to speed really quickly.

2. Be very careful about spending $100 on a scanner, if you find you
enjoy it you will get very frustrated with such a device very quickly.
You will have difficulty selling such a device second hand as well. The
resale value of scanners under $1000 seems to be $100 below the original
price so you will not lose out by spending more money. Look at
http://www.javiation.co.uk for some interesting prices

I'm currently trying to decide between a Realistic PRO26 or a Yupiteru
MVT7100. But I also noticed that the Sony ICF-SC1 is being offered at
Yahoo at a rock botton price. Apparantly it's a bit quirky as scanners
go, but has very good reviews.

Cheers

LF :)

Trust me.. spend the $$ on the scanner you want... get a trunking unit....
You will start scanning and go nuts once you get into listening.... you
would wish you got the trunking unit as your first purchase......

I have owned two Icom R2's. In comparing them with my
BC3000xlt and Pro 2048 I find the performance in the
42-50 MHz range to be woeful in sensitivity. Has anyone
experienced anything similar?

Snip
I guess I am an old foggy and have lost my sense of adventure.
I try to avoid ALL intereactions with ALL police. I much prefer
fo listen to thier shannigins on the scanner.
The local police use CB for "close in" talk about because it is not
recorded by "Big Brother" downtown in teh police comm senter.
A few are hams and used to hang out on some fairly obscure 2mtr freqs,
but too many people have scanner and they like to hide.
Today they are mostly switching to cell phones, Which, as we all know,
is an extremely [un]secure system.
The local university police are convinced that there GE trunk system
is "Scambled" and imposible to monitor. I decided not to waste the time
and energy trying to educate them. After all, I like being able to
listen to their "scrambled" comms!

4444. Introduction to Scanning

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Other frequency web sites include:
http://www.fordyce.org/scanning/ and
http://www.scannerway.8m.com.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or

anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the

channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have

the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus

service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120

Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the

scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models

are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also

Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See | http://home.cfl.rr.com/scan/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO).

Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio,

otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke

sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the

ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier

vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder.

Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see

"The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more

than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has

some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod

immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners

have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they

were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock

out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models

differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan-nels	VHF low	VHF high	UHF scans?	lock-outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

HAMFEST/COMPUTERFEST CALENDAR 2000 - ILLINOIS
last updated June 15, 2000 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, John Wass KA9QJX, Tom Harker, and ARRL for providing some of the information.

JUNE 2000

Jun 4 (Sun): Princeton - IL Starved Rock RC. Bureau County Fairgrounds. Exit 56 from I-80. Admission $7 (ouch!) at gate. Talk-in 146.955, -600, PL103.5 Hz. info: AL Erbrederis, tel. 1-815-498-9675, 262 Easy St., Somanauk IL.60552. ERB.N9PIB@juno.com. http://www.qsl.net/w9mks. E-mail: w9mks@qsl.net. (Usually an excellent hamfest. Unlimited space outdoor flea market, some indoor space, though few big name commercial vendors. Crude restroom facilities. - AJ9S)

Jun 11 (Sun): Wheaton, IL - Six Meter Club of Chicago. http://cyberconnect.com/orion/smcc.html. Info: Joseph Gutwein, WA9RIJ, 7109 Blackburn Avenue, Downers Grove, IL 60516-3925. Tel: 630-963-4922 or 708-442-4961 . Email: wa9rij@mc.net

Jun 18 (Sun): Crown Point, IN - Lake County (IN) ARC. | Fathers' Day Hamfest/Computerfest. Lake County Fairgrounds, | 889 South Court St. Admission $5. Tables $6. Commercial | vendors, indoor flea market, food and beverages, walk-in VE | testing. Totally indoors. Info: | http://www.icongrp.com/~kb9mnq/lcarc/hamfest.htm |

Jun 24 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jun 25 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

JULY 2000

Jul 8 (Sat): Oak Creek, WI - South Milwaukee ARC. American Legion Post 434, 9327 South Shepard Ave. Admission $5. Talk-in 146.52 MHz. Info, call (414)762-3235.

Jul 9 (Sun): Peotone, IL - Kankakee Area Radio Society, Will County Fairgrounds. I-57 to Peotone exist 327 (East). Free parking. Talk-in 146.94 MHz. http://www.w9az.com. Admission $5. Info: Don Kerouac, K9NR, 6311 East Flora St., Kankakee, IL 60901. Tel: 815-939-7548. Email: k9nr@juno.com

Jul 15 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jul 23 (Sun): Sugar Grove, IL - Fox River Radio League. Waubonsee Community College. Admission $5. http://www.frrl.org/hamfest.html Info: Maurice Schietecatte, W9CEO, 813 Cindy Lane, Sandwich, IL 60548. Tel: 815-786-2860. Email: w9ceo@arrl.net (good, small to midsized hamfest. Easy parking. Modern restroom facilities. - AJ9S)

AUGUST 2000

Aug 12 (Sat): Quincy, IL - Western Illinois ARC. http://www.qsl.net/w9awe. Info: Jim Funk, N9JF, PO Box 3132, Quincy, IL 62305-3132. Tel: 217-336-4191 . Email: jfunk@adams.net

Aug 13 (Sun): Peotone, IL - 66th Annual Hamfesters Hamfest. Will County Fairgrounds. 45 mintues from Downtown Chicago, take I-57 to Peotone Exut 327 (East). 35 acres of free parking. 14,200 square feet of exhibits open at 8 AM. Flea market open at 6 AM to 3 PM. No additional charge for flea market space. Rain or shine -six covered pavilions for Flea Market. Tickets are $4.00 in advance with double stub, $5.00 at gate with single stub. Children under 12 free. Advance ticket sales and information: SASE and check by July 25th, Christine Mack, PO Box 2161, Oak Park, IL 60303. tel. 708-358-1786, email: christine1@mediaone.net. Talk in on 146.52 simplex and 146.64-(107.2) Stars Repeater

Aug 19 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Aug 27 (Sun): Danville, IL - Vermilion County ARA. Info: Gary Denison, KA9SKS, 14704 East 2750 North Road, Danville, IL 61834-5610. Tel: 217-759-7389 . Email: gdenison@danville.net

Aug 27 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College

Rd. 9:30 AM - 3 PM. Admission $6, children $2.

SEPTEMBER 2000

Sep 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Sep 16 & 17 (Sat & Sun): Peoria, IL - Peoria Area ARC. Info: Ron Morgan, KB9NW, or John Coker, N9FAM, both c/o: PO Box 3508, Peoria, IL 61612-3508. tel: (309)692-3378. Email kb9nw@juno.com or n9fam@juno.com. http://www.peoriasuperfest.com

Sep 23 & 24 (Sat & Sun): Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. http://www.chicagofmclub.org. Admission $8, good both days. Info: Mike Brost, WA9FTS, 5127 North Monterey Avenue, Norridge, IL 60706. Tel: 708-457-0966, Email: mbrost@cin.net (the biggest and best hamfest in northern IL - AJ9S)

Sep 24 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

OCTOBER 2000

Oct 14 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Oct 22 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

NOVEMBER 2000

Nov 5 (Sun): Davenport, IA - Davenport Radio Club. Iowa National Guard Hanger, Mt. Joy Airport. Talk-in 146.88 MHz repeater. http://www.gwltd.com/hamfest

Nov 18 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Nov 18, 19 (Sat, Sun): Ft. Wayne, IN Fort Wayne Hamfest & Computer Expo. Allen County Amateur Radio Technical Society. 2000 Indiana ARRL State Convention. Allen County War Memorial Coliseum Exposition Center. Hours 9 AM - 4 PM EST Sat, 9 AM - 3 PM EST Sun. Admission $5 plus $2 parking. http://www.acarts.com

Nov 26 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

DECEMBER 2000

Dec 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30 AM to 3:00 PM. This show features computers, supplies, games, parts, software, accessories, CD-ROM, monitors, diskettes, printers, keyboards, modems, disk drives, cables, expansion boards, services, etc. Lake County Fairgrounds, Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall Building #1=9720,000 sq. feet. For a show map, exhibitor info, and discount coupon, visit the web site at http://www.ccxpo.com.

There are a few municipalities, though, that claim to have laws regarding scanners in vehicles. I know that Parma, Ohio (Who think they're above the law) claims to have such a law. But, after looking through EVERY law book for the city of Parma, Ohio, I was unable to find any such law.

Hey Jeff,

Why don't you follow your advice to others and contain your reply to the amateur radio newsgroup? Most of us here on the scanner group could give a rat's rear about ham radio. It's just a bunch of old, white guys who are at least 30 years behind the technology curve and to whom life's most important issue is whether or not to require Morse code testing for new ham operators.

Where's that famous "followups directed to rec.radio.amateur.misc" tag line that you often impose on others?

4459. Re: Amateurs must let go if ham radio is to survive.

Interesting that so many of the newer Hams continue to tout the "Public service" aspect. My experience with this group is that they are generally fat, lazy, often semi-literate, "cop wannabes". Most have never been in any position of authority nor exercise any sort of control over their lives. This frustrates them. They see "Public service" as a chance to carry a radio on their belt and be "important".

While the professional officers always warn these folks to leave the policing to them, invariably, these cop-wannabes take matters into their own hands, ultimately botching the situation and giving Amateur Radio yet another "black eye".

If they were **really** interested in "Public service", how about volunteering at the library, local hospital, animal shelter or soup kitchen? Oh, no one to "boss around" there. Couldn't "look cool" with that 8 pound brick on your belt. Sorry, should have known.

Or, so it seems to me.

In article <3947E3E2.6569519F@FSI.NET>, "Mark says...

Source record: 86625

Thanks for all the great replies! I currently have an R5000 for HF and an R7100 for V/Uhf in the shack but I want something I can carry out in the yard and hear police, etc. and hams on 80 meter ssb for example. I picked up a new Icom R10 at Dayton which I really love except that the HF needs a better antenna. With a Radio Shack $10 whip I can hear ssb ok (and V/UHF even BETTER!) but would like to get the best possible HF receiver for a handheld. With the stock Icom rubber duck antenna you don't pick up much below 50 mhz! Looks like the Yupi MVT9000 M2 or M3(?) or AOR might fit my needs...
Again, Thanks,
Jeff

Both ham radio and CB suffer from this phenomenon, but not to the
degree you imply.

Our club provides assistance to the Red Cross, various athletic
events, and on a continuing basis through the county emergency
operations center and Skywarn.

Most people don't get into ham radio as a way to do public service.
It's usually the other way around. You get a licence, and then
discover the opportunities to serve that utilize your abilities as a
ham, beyond what a non-ham can provide. In my case, I feel that
since the public is loaning us these bands to operate on, we should
perform some public service in return. We certainly see enough
instances where normal communications channels aren't suficient in an
emergency..

During the Y2k rollover, we were on standby to provide communications
in case the county's 800 system went down.
Motorola couldn't provide any assurances that it would remain
operational, but our radios simply don't care about the date. As it
happened, nothing happened. I didn't expect anything to happen
either, but we were there.

Last week I had a downburst near where I was storm spotting. It took
out the phone lines, and the cell system lost eight towers from the
same storm. The area happens to be on the fringe of the county's 800
MHz system, so the only thing that was working, in terms of getting
help and reporting what was going on, was our 2 meter repeater.

A month ago, we had a severe hailstorm, and our advance warnings
probably saved lives. With several square miles covered with

baseball sized hail, we had no injuries, and only unavoidable property damage.

Yes, my car flies Skywarn signage, and flashing lights. At the request of the county EOC director.

I also carry an ID that extends his authority through me, so I can get past police roadblocks in an emergency, and be on the street during snow emergencies. We routinely carry patients to the hospital for dialysis and deliver urgently needed prescriptions during heavy snowstorms. This could be done by ambulances, but we free them up to make more serious runs, that we can't handle.

We are very aware of the "cop wannabee" problem, and if we ever see it happening, we will step on it fast.

As for literate, I'll let my movers answer that one. I had enough books in my last move to double the packing time from their original estimate.

> If they were **really** interested in "Public service", how about
> volunteering at the library, local hospital, animal shelter or soup
> kitchen? Oh, no one to "boss around" there. Couldn't "look cool"
> with that 8 pound brick on your belt. Sorry, should have known.

Not interested in "bossing anyone around", and I don't "look cool" with or without a radio.

When I lived in rural california, within a month of moving into town, I had signed up for the fire department. This is an unpaid, totally uncompensated position, that requires many hours of training, and many many interruptions at any hour of the day or night. Most of our calls were called out to freeway accidents, so it wasn't even helping anyone we knew, or were ever likely to see again. I did take a certain amount of pride in being a fireman, who wouldn't? The interesting thing is, I was just as happy to be in doing equipment checks or cleaning hoses as pulling people out of wrecked cars, or putting out fires. It also taught me a lot about myself, like that I make a better follower than a leader. Funny thing is, when I realized that, I expected to be disappointed somehow, but I wasn't. I'm prefectly happy not to be in charge.

When I first got my licence, I lived in Anaheim Ca, and belonged to a group of hams who were also amateur seismologists. (comes with the territory, literally) Don't laugh, when a quake occurred, the news media and city officials went to us first to find out what was happening, then to Cal tech for the official (but somewhat delayed) story. The watershed event for this was in the simi valley quake, we had the center of damage pegged properly, but epicenter determinations from caltech sent all the emergency equipment into an area where there was very little damage. This is where the city governments learned the difference between the epicenter and the hypocenter, and that seismometers can't find the hypocenter in any

useful sense. With our many observers all over the area, we could pin the damage center very quickly, usually in just a couple of minutes. It was very similar in effect to Skywarn here in the midwest. The NWS radars are fine, but they don't cover as well as you think, they have a six minute delay, and they can't tell you what's happening nearly as well as a trained observer at the site.

Am I a typical ham? I don't know. I guess I'd like to think so.

What public service have you done lately?

Source record: 86634

Um, couldn't you tell by putting a scope probe on each pin and
turning the thing off and then on? The serial output pin will
most likely wiggle on power-up. Also, the serial input pin will
probably have some noise on it, compared with the ground. Open
the thing up and see which pin is connected to the big fat trace
on the main PC board. That's prolly ground...

With an address of "HotPrsut" one would assume that you're referring to yourself. However, since you chose to address your sweeping generalization to my posting, I'll reply to it.

It just so happens that the fire chief of the community for which I provide communications assistance, was involved in hurricane Andrew. He saw the value of having ham radio assistance during emergencies and has had the participation of amateur radio volunteers written into the village's disaster plan. The local police and fire dept. personnel welcome our assistance and we have access to their frequencies as well as certain facilities that are not open to the public.

There are 8 of us in the group, and none fit your generalization. Many are professionals, and some, like myself, own our own companies.

In the future, you may want to refrain from describing yourself when you really mean to slam someone else.

Or you could do what I am doing: Teaching Tech licensing classes to bring new hams on board. Some places to try: Boy/girl scouts, schools, local 'adult' education, recreation centers. If you really have the need you can wear your radio on your belt and boss your students around ;-)

73's all,

As I understand it, the trunking system will remain 'analog,' in that it's a standard type II control, but the tranceivers are being switched to the APCO 25 standard. If this is the case, you'd need an APCO capable 800mhz radio to monitor.

4486. Trunking/non-trunking question.

Newsgroup: rec.radio.scanner
Date: 2000-06-15 00:00:00 UTC

Message-ID: <coop62-1406002220050001@c532593-a.wtrlo1.ia.home.com>
Source record: 86691

Hi folks,
I've been considering getting a scanner and have been trying to do a little research before I take the plunge. The handheld scanners under a hundred dollars that I've been able to find are non-trunking and have a 29 to 512 mhz range. Specifically the Uniden BC60XLT is available at Walmart for 80 dollars.
I would think this would be a decent beginner's scanner. I won't be able to listen to the local police, since they're on a trunking system that I'm told operates around 860 mhz, but won't there be quite a bit to listen to even without
the 800 mhz range?
This is a small urban area of about 150000 with an airport and a national guard armory.

Thanks in advance for the feedback.

Mark

Mark:

You might want to consider saving up a few more bucks, and buy a used Radio Shack PRO-91, or a Uniden BC235-XLT. They are almost identical...and the Radio Shack unit is manufactured for them by Uniden. They cover the 800MHz band, and both have Trunktracking capabilities too! Street price on a "like new", used one, is in the area of: $100~$125.00.

Motorola and Ericson are two different (mutually exclusive) trunking
systems. There is a scanner (Uniden's BC245 comes to mind, RS has one, but I
don't know their model number) that can track both types of trunking systems,
but not at the same time.

I don't know of any ARRL Director that I believe would support that proposal. The ARRL's policy has consistently supported having the FCC be the regulator of Amatuer radio. Can you point to any ARRL policy of statement of any Director on which you base your conclusion?

I can state categorically that I would not support any decision, ARRL or other, that would eliminate Amateur Radio licensing.

This is true however if people know this latest
move by Flatulating Zipperhead, perhaps we can
get a "few" letters written to the Court too... grin

4496. Introduction - Speech Inversion Descrambling/Scrambling

Newsgroup: rec.radio.scanner
Date: 2000-06-16 00:00:00 UTC
From: ctpds49@aol.com
Message-ID: <20000616161401.28921.00003239@ng-bj1.aol.com>
Source record: 86452

Speech Inversion is accomplished by mixing the speech spectrum
(typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some
audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz
constituting the speech inversion.

Ed,
What he is saying is, in HIS opinion, (I won't comment on it's worth), the
ARRL's support of the recent restructuring is the same as eliminating
amateur radio. Sour Grapes, in other words.

Mr. Baggums,
It's called STALLING. Herbie has no confidence whatsoever in his frivilous garbage being heard by the S.C. All he's doing is hoping and praying for a Bush victory in November and with it a revamping of the S.C. along with the F.C.C.

Although being a staunch Herbie hater lo these many years, I must give credit where credit is due and difficult as it is to admit, so far the felon has made monkeys out of the F.C.C. Let's see now-when did he start lying to Judge Luton-I think it was in 1994. Can you believe that the guy's still on the air with a call removed from the FCC database when Moses parted the Red Sea and Jesus walked on water?

God, the guy has used every type of appeal short of a banana-has essentially tied up the Feds in a mass of paperwork and has cost the taxpaying citizenry probably a million bucks or more. It's called due process while some of us refer to it as a "doo doo process."

And from what I hear, whenever he does make an appearance on 14.313, it's the same old bullsnot he's been pulling forever. Attacks on Intercon, Ruth Hoffman, AF2Y, WB2OTK and other sterling ops while Riley Hollingsworth sits there quietly never citing him for agitating which he decries and about which he writes threatening letters. Why not you ask? Because if he pops FZ, IT'S APPEAL TIME LADIES AND GENTLEMAN and the saga continues.

I have a PRO-2006 400 channel scanner I would like to sell. It also has
the
LED modification done and it looks pretty sharp and works great. I
don't have
any photo's currently but I can get some taken. Original box but not
original manual
(photocopied) Asking $300 and you pay shipping/handeling.

Thanks, Steve

Yes. Access the configuration menu when in expert mode. You do
this by pressing FUNC and LOCAL. push DOWN until you get to AUTO STORE
BANK J ON and turn the control knob on the top to change "ON" to "OFF".
Reminder you have to be in expert mode and you set this from the same
[FUNC] [DOWN] sequence. Check page 97 of the manual

I currently use a Yupi 9000. Sometimes I need to carry three user guides with me to perform certain functions. It is MUCH different from Bearcat and Radio Shack scanners. However, I love the radio. It has outstanding coverage, sensitivity and audio capabilities. You are in for a lot of reading if you've never had one of these before!

I have a BC245 and SC1. Their audio is terrible to begin with and in a car the scanner is almost useless - well maybe I am exaggerating a little. Anyway, get yourself a CD car adapter. I bought one in K-Mart last night for $10 (RCA). The also have one for $15 made by Sony. Plug it in and the improvement is outstanding.

Hi Bill,

This is just not true. The Broadcast towers I maintain, as well as
ones all over the world take many direct hits every year with out damage
to equipment. It takes a understanding of the forces you are dealing
with, and proper implementation of ground windowing techniques, and can
be very costly. But very high degrees of lightning protection can be
achieved. One thing is for sure, a single ground rod does not make a
effective lightning dissipation path. If this is the best you can do
you are better off going without any path at all. All you will be doing
with such a marginal system is attracting lightning without providing a
path to harmlessly dissipate it. This is a real recipe for disaster.

That is true. It is almost impossible to retro-fit any building
properly. To do it right a Ufer ground should be included in the
construction phase of the building that will house the equipment.

I just bought a scanner. I don't know why. I guess it was an impulse thing. What are the frequencies? What should I be hearing? Should I buy a battery? Can I use it in my car? How about in an airplane? Why does it not make any noise at all? Can I plug it into a wall socket and listen to it under the water in my bath tub? Can I hear the Teletubbies on it? They have antennas...don't they? The only frequency that shows up is 000.0000. It has this on all the frequency buttons. Can the FBI tell when I'm listening? Do I need a better antenna? Can I hear anything while on a Carribbean cruise? Can I hear the space shuttle? How about those ham radio short wave fellas? Can I hear those NASCAR racers? What should I learn? Is this radio hard to learn to use? What's a "mod"? Can I make cellular calls on my scanner? If my scanner is on, will it keep the police from knowing how fast I'm going? Does this flexible rubber antenna have any other uses? It sure will make a really neat paper weight when I get tired of it. If I were to sell it, would it be worth more if it had more numbers in it? Can I hear those erotic G-spots I keep hearing about? Where can I find the G-spot? Should I get a linear amplifier for it? CBers. What about the truckers on CB? Can I hear the big rigs when they rumble down the highway crashin' the gate doin' 98? Where can I get a copy of the 10-codes? Should I hold it vertically or horizontally? Can anyone help me? Thank you.

What's even better is the Sound Feeder SF-100 that provides voltage to run the scanner and transmits the sound to the car's FM radio. $19.95

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=356023290

The cassette based adapters are ok but there is a continuing sound made by the cassette transport wheels turning. Also if your car's radio does not have a cassette player then you can't use those types.

As a long time Proo2004 owner/user perhaps I could answer your question if
you rephrased it so that I could understand what you mean.
IF you mean "can I listen below 25MHz, above 1300MHz or or to the dead
band in the middle" then "No., If you are asking if you can listen to the
locked out 800+MHz [cell] frequencies, the answer is "Yes, but"....
The 'but' going into a modification on the logic board. Not hard, just do a
net search for Pro2004/5/6 cell mods or the like and you can "open" the
radio up.
Just do not get caught listening, or these days with a modified radio.
Of course I still wonder if my antique Panasonic portable TV, that receives
cell calls better that TV, is now or soon wil be illegal.

As someone who is NOT selling one of these devices, I would like to counter that the one I had sucked. I suggest that you purchase one from someone that will accept returns if you don't like it. I bought a powered extension speaker from Radio Shack and wired a cigarette plug to it. The speaker can then be moved from vehicle to vehicle. Attaching the stiff side of some velcro lets you place it on velour or cloth seats or the carpeted floor and it'll stay put.

Flash...News Item...
(text file also attached)

Sanders Electronics, under funding from the Department of Defense at USAF Rome Laboratory, is developing an advanced electronic warfare monitoring system which uses adaptive scanning to increase the system's attention to certain bands or services when the system detects certain types of activity. But the good news is that you don't have to join the Air Force or spend millions to get the same capability right at home with your scanner!

Datafile, Inc. of Saint Louis, MO has introduced version 6.0 of "Probe", the powerful and versatile control program for the Optoelectronics Optoscan computer interface systems, or the Optoelectronics Optocom "black box" receiver. Probe works with the OS456/OS535/Optoscan Lite series interfaces for the Radio Shack Pro-2006, Pro-2042, etc. generation scanners, as well as the Optocom. Some of Probe's features are only available with certain receiver/interface combinations, though Probe greatly improves the functionality of any of these radios.

Unlike many other interfaces the Probe system works only with these radios. As a result, the developers have been able to really custom-tune the system to best serve the needs of the owners of these particular radios. Probe operates in a DOS prompt window or DOS environment and requires an IBM compatible computer running MS/PC-DOS version 3.1 or higher, 640K RAM, a free serial port and hard disk. Probe needs at least 512K RAM of conventional memory free to run. I tested Probe using an Acer 486 DX2 running at 66 Mhz and a Radio Shack 2006 with the Opto 456 interface board. I have seen Probe running quite efficiently on 286 class systems, though it will run faster on faster computers and radios.

Probe installed off the floppy disc problem free for me. I was able to install it in either my master hard disc or a slave drive with no problems. The installation documentation was clear and accurate and the programmed worked fine on the first try.

For the uninitiated computer controlled scanning adds an entire new dimension to the hobby. It frees the user from all constraints of memory limitations, bank size, structure and number, etc. It also opens a new vista of recording signal activity detected by your radio, and it enables these functions to operate unattended. In addition, many new features are added, such as PL/CTCSS/DPL receive, signal strength monitoring, alphanumeric tagging, signal alarms, adjustable delays, temporary lockouts, and many others.

Probe offers very high performance monitoring using these radios. On my system Probe scanned my PRO-2006 at over 42 Channels per second, much faster than the stock 28 channels per second in scan mode. (Version 6.0 would appear to run a

good deal faster than earlier versions, which were already fast). Even at this high speed my radio still stopped scanning for very, very weak signals. Faster computers using the Optocom or 2042 series/535 interface will approach 100 channels per second. Search operations run at a similar rate. Probe's scanning parameters can be hand "tweaked" for experimenting with even faster operating speeds.

In an experiment I programmed a few of Probe's memory channels for CTCSS tone receive and then started scanning, while generating signals with non-programmed tones on those frequencies. This forced Probe to do a "tone check" on every single memory channel as it scanned. Even under this very trying condition, and using my slow system, I still clocked Probe doing over 20 channels per second scanning at it's slowest. (Momentary interference hardly fazed the scanning speed at all).

A few other notes on PL/CTCSS/DPL receive as a feature... Here in Chicago interference, pager intermod and a very crowded spectrum are the norm. We treasure PL receive as a great way to help sort out the spectrum and to selectively monitor certain users of crowded channels. Probe's implementation of this feature is truly outstanding. The default program settings produce fine performance, but Version 6.0 now allows the user to very precisely adjust virtually every parameter of the PL receive function. A new "tone engine" produces much more accurate tone receive than in earlier versions, which were pretty darn good at it themselves!

In addition, this one of the very few radio configurations anywhere that will permit the user to perform "carrier squelch" receive. That is, the radio only "opens up", or stops scanning, for signals that DON'T have a PL tone behind them. Again, very useful on crowded frequencies. 6.0 also allows you to search selectively using a tone you select, another really neat feature. Probe also, of course, displays the active tone, if any, turning your radio into a tone detector/display unit, as well!

Other new features in Version 6.0 include;

-Fully configurable mouse support

-10 quickly selectable Hypergroups of memory channels activated by keys.

-10 quickly selectable VFO single memory presets. Each stores a mode, tone, step rate and description. You can quickly tune up or down from each. I found this a particularly handy new feature. It's like having ten different radios right at your fingertips... well...almost.

-Improved manual tuning function to work with the VFO presets above.

-Improved Temporary Lockout functions.

-Priority frequency pause/hold key enabled.

-Priority frequency delay time adjustable. (Priority sample rates were already adjustable).

-Many improvements to the Log and Frequency viewer system. Sorting by Name enabled and custom configurations can now be saved or retained according to individual group files.

-Bearing indicator display for memories programmed with the lat/long information.

But the new feature I liked best isn't listed in the instructions. On my shaky, archaic system I had experienced some file instability problems with earlier versions of Probe. I was pleased as punch to find these problems have vanished with Version 6.0. After several weeks of running many different Probe files, banks, groups, features and configurations I experienced not a single crash, bump, freeze or loss. Everything ran smooth as silk with no glitches, at even higher speeds and with more features than before. Other interface programs seem to get slower and slower as each new version is released and the features get added on. Not Probe, it just gets better and faster. This is the mark of quality programming.

As for that electronic warfare... From early on Probe has included a feature called SmartScan. You set certain frequencies to trigger the interface to switch to, or to start including, a specific "smart bank" set of frequencies when it detects activity. This can be used many different ways. Set it for a local military operating area primary channel. When Probe hears something there, it starts scanning an entire bank of tactical air to air channels. Set it for a federal agency's primary channel. When it hears something there it switches to an entire bank full of federal frequencies. Set it for your airport's ground taxi clearance channel and the radio switches to a bank for your local air traffic control. You get the idea, pretty neat stuff!

Probe 6.0 offers dozens of other great features, too. It supports a wide variety of file format import and export, which just might save you one heck of a lot of typing. It will import FCC database files in the .DBF (Dbase III) format and will export to fixed field length ASCII, delimited ASCII, non-delimited ASCII and the popular UFDBF formats. Probe can generate sequential step memory files, log all detected tones while searching/scanning, or just unique "finds" and take control of the radio's "zerotune" feature. There are also many upgrades to the program's unique editing features used while entering and updating data.

Any program that offers this much functionality can't be called "simple". But the program comes with over 75 pages of progressive, easy to follow, well written documentation. Learning to use the program is really quite fun. The manual includes sections on errors, problem solving and trouble shooting. And if you really get into trouble Datafile's user support is legendary in quality. (Around the new releases they sometimes get a little back-logged due to heavy demand, be patient in the beginning).

Over the years I've experimented with many different interface programs for the Opto boards and radios, including Scanstar, Scancat, Radio Manager, and many other freeware / shareware platforms. With Probe 6.0, I'm finally won over. I find I just can't beat this combination of speed, stability and features. If you use the Opto interfaces with a 2006-2042 series radio this is a "must-have" item. If you use the Optocom black box radio this is THE software to run for

semi-conventional (non-trunked) listening.

Source record: 86578
Body handling: Binary attachment payload not displayed: dbertone.vcf

This one is in real nice shape and has the original manual.

It was the FIRST user programmable scanner that used the scan buttons as
dipswitches to program
using codes from the manual.

16 blinking lights are great to watch and you can lockout any channel
using the switches.

It was the first scanner to do away with crystals.

Very collectable.

$150 or take a good regular scanner in trade or trade in as this one
should be just sitting in a collectors
shelf.

Evereything works fine on it with no problems or burned out lights,
loose switches or any other
problem.

[One or more binary attachments are retained only in the source text.]

Welcome to the wonderful world of scanning! There are two main uses for
a scanner:

1. put it on top of a stack of papers to keep them from blowing away,

2. jam it under a door to keep it from closing.

Happy scanning!

I guess both those theories would surprise me, just based on the
massive size of this thing. I would have expected it to be a reciever
for very low frequency, very low power transmissions, but I may very
well be wrong. Keep in mind the orientation is Straight Up, which
lends some credence to the satelite hunch. Couldn't see the base of
it to see if there were any tracking motors present.

Alex:

You can run the AR8000 with the AC adapter while the batteries are removed. I would strongly suggest that you use an external charger for your batteries (get some high capacity NiMH batteries they last longer than NiCads). The internal charger overcharges the batteries making them very warm. This will damage them. Better to use the external.

Good luck.

Keith

By now Irvine and Tustin PD's are on the trunked system, the other PD's and OC agencies are to follow. Their audio is digital (sounds like a data channel). There probably are other agencies on as well. The FD's supposed to stay analog for the moment but will probably go digital then it will be lights out for us scanner listeners in OC.

Seems lately there has been a lot of talk about bad PRO-2004's with defective solder joint problems. Guess I must be one of the lucky ones because mine works great, even for long hours! Never had a solder joint problem! Although the internal power supply was removed, it can still get warm. I love this scanner! Anybody else been using a PRO-2004 for years without any problems?

Call the Regional Communications Center. It should be listed in your phone
book.
Routing Symbol should be ASO-6.

VOR's are not normally installed in areas where they can have a signal
reflection.
The Atlanta VOR (ATL) is located on the Airport.
The Peachtree VOR (PDK) is located on the Dekalb-Peachtree Airport.
A VOR would look like an inverted ice cream cone with a large circular base.

the upside down umbrella is a discone antenna
Discones have the advantage of working well over a variety of frequencies.

For example, they can work both on VHF (118-136 AM modulation) and
UHF(225-400 mhz AM modulation) Discones can also pick up the FAA operations
frequencies in the 170mhz range
as well.

Have you read the manual It helps out allot.
First you have to select a bank to scan.
Then you have to put only one system at a time in each bank.
do not put more than one in each bank.
press and hold the trunk puttee then the display will.
flash sleeted the bank then select the sys type e2 uhf mot et.
press enter now you should be able to enter the freq. make sure the m is
onthe disp.
make sure you have the control channel enter for that sys. and it is not
locked out.
once you have the control ch in and the rest of the freq. it should start
searching for
ids . please read the manual. that is what i did. If you need help you can
cal me
at 801-484-2815 after 5 pm sunday through sunday i hope that helps you Dave

Source record: 86507

Hi,

I dropped my XLT a couple of feet onto a carpeted floor. Since then, the bank "j" button does not work, the lock button does not work, and because of that, the rotary dial does not work.

What is the likelihood that I would be able to find the fault and repair it myself? I'm fairly handy with electronics repairs.

I don't have a schematic.

Should I bother opening it, or should I send it off the Uniden when the next feature breaks?

Thanks for any helpful reply.

This seems to be a fairly complete list of scanner magazines/newsletters. Corrections and additions gratefully accepted.

American Scannergram - (All Ohio Scanner Club) - bimonthly - readers supply info for OH, DE, DC, IN, KN, MD, MI, NJ, NY, PA, VA, WV, + New England - http://www.aosc.org/

National Communications - (Bearcat Radio Club) - http://www.bearcat1.com (basic scanner info - monthly)

Scanning USA - http://www.scanningusa.com - monthly - available vis subscriptions and newstands - general scanner info + specialty columns (RR + air + etc)

Scanner Digest - East Coast (VA to ME) - bimonthly - approx 50 pages per issue - approx 23 column editors - (successor to NESN) - ScannerDigest@usa.net

Capitol Hill Monitors - Wash DC area scanner newsletter - approx 10 pages per issue - was bimonthly - henney@doubled.com - (see Scan-DC@qth.net for Email list)

The Repeater - Communications Research Group - by Scott Miller of Sun Prairie WI - quarterly - has a website IIRC
?BASE newsletter - San Francisco area - ?still in production?

Monitoring Times - http://www.grove-ent.com (has multi specialty scanner columns in a monthly magazine)

Popular Communications (?from Comack NY)(irregular scanning column - monthly)

www.usscanner.com - online only - US Scanner Magazine - general info - based in ?Portland OR

There are several other clubs that incorporate "Scanning" into their newsletters, although it may or may not be the major focus.

The Messenger (Canadian International DX Association) http://www.anarc.org/cidx
DX World (Miami Valley DX Club) http://www.anarc.org/mvdxc

(I know that Chicago Area Radio Monitoring Association (CARMA) in Chicago no longer produces a printed newsletter - that stopped about 2 years ago in ?1998)(see CARMA@qth.net for Email list)(CARMA has a great website also)
==========
Anybody have more updates or corrections? Detroit, Minneapolis, Los

Angeles, Seattle, Phoenix, Atlanta - do you have any newsletters or magazines?

Peter S - Boston MA

yidem@my-deja.com (Yidem) asked:
> What frequency range should one use for scanning the cellular band
> in Canada? Currently I have 902.100 - 903.870MHz in .30MHz steps.

From the FAF - Frequently Asked Frequencies
on http://www.strongsignals.net/htm/oak_faf.htm

Cellular Telephone [22.902]

Chs Freqs (base) System Use

991-1023 869.040 - 870.000 A - RCC voice
1-312 870.030 - 879.360 A - RCC voice
313-333 879.390 - 879.990 A - RCC data
334-354 880.020 - 880.620 B - Telco data
355-666 880.650 - 889.980 B - Telco voice
667-716 890.010 - 891.480 A - RCC voice
717-799 891.510 - 893.970 B - Telco voice

Transmissions are FM (some systems are adding digital).
Channels are 30 kHz apart. Mobiles transmit 45 MHz below the
base (824.040-848.970) and are usually repeated by the base.
Channels 991-1023 are also identified as Chs 800-832.

Thanks for the great pointer, I found it very useful. Perhaps this
URL should be included in the NGs FAQ. Few questions,
Wouldn't all frequencies be the "mobile" vs. "base"?
My base has intercepted several that are in the early 900MHz, why
aren't these listed?
I get a lot of static (data? digital?) channels in that range, perhaps
at different stages of the day, is it best to lock these channels out?
My scanner can only handle blocking 50 channels, if there a
better/easier way to avoid the non-voice frequencies?

We are looking for a technician/salesperson. This person would have ultimate responsibility for their block of customers, and be responsible for that customers scheduling, service, sales, and overall satisfaction.

You are backed up by other techs and salespeople, who will assist you with your projects.

You are also responsible for your areas overall profit. Your bonuses, paid monthly, are based on that profit. You can expect 40-50k reasonably in a year bonus. <We can show you other W2's to prove that it does happen, time after time> Salary DOE.

This is not a job for the meek. It is not 40 hours. It is however very satisfying, and the closest thing to owning the company without the risks.

We are a Motorola dealer and MSS.

We are also looking for a technician for both bench and field work.

Actually, Mackey jumped into a conversation, accused me of things
that it was obvious to anyone with an 8th grade education I did not
do, accusing me of starting crap, and refuses to admit that HE
was the one wrong. If he had just done that, none of this thread
would have even had a chance to get started.

He obviously has no desire to stop the crap, and this thread
has been proof of that.

Now, to lurch this onto topic, Arkansas Department of Corrections,
including the prisons, probation and parol, and administration,
has ?upgraded? all their radios to VHF Kenwood radios. Low band
is still in use in the prisons themselfs, but VHF highband is
being used for interagency communications

Have any larger agencies in your area gone to Kenwood radios?

PCSCAN DOS Scanner Program for the PCR-1000 and other radios
==========
New version available!

http://www.micosyen.com/radio.htm

- Motorola type II trunking integrated with conventional scanning
- Runs on any x86 PC--Windoze and Pentium not required (nor desired)
- Only a 386SX-20 required for trunking
- Infrared remote control (extra hardware required)
- Unlimited channels in up to 10 banks
- DTMF decoder display
- CTCSS squelch and auto-search
- Temporary channel lockout
- Big frequency display can be seen from across the room
- Time-of-day display
- Auto detection of radio type
- Auto detection of trunk control channel & data slicer polarity
- Optimized for the PCR-1000, but is tested and known to work with

AR-3000A
AR-8000 (with OptoLynx)
AR-5000 (DTMF decode still not working)
R-9000

- Drivers installed for the following but not tested/working

AR-8200
R-7000
R-7100
R-8500
OptoCom
User-specified Icom CIV
BC-895XLT
BC-245XLT

Owners of these radios are being sought to assist in finalizing
functionality and driver development. Use the e-mail link on the web
page.

New features added:

- 286 and 8088 versions (processors too slow for trunking)
- Individual bank squelch levels
- More versatile trunk ID filtering

This is still the best free computer-radio scanner program available at any price.

I'm headed to Grand Rapids, MI sometime in late July to visit family, and was wondering if there had been any changes in the last year or so to radio systems in the area. As my "scanners" are vhf & uhf saber III's, I have to have everything loaded (correctly) before I leave. If anyone has a good list of frequencies with PLs, I would appreciate the help.

Thanks,

Andy Clark

AOR® AR 8000
Condition: good/very good, manual tuning nob is loose, keypad 'tuner'
performs the same functions so there is little or no effect on
operation. This receiver has been adapted by Grove☐ to accept a
connection for the Optoelectronics® R11☐ Test Receiver, and can
"restore" the two missing bands via software such as Scancat Gold®.
>not that any 1 would do that :-)

Optoelectronics® R11 test receiver;
Condition: Excellent. Reaction tunes the receiver above.
Included N 100
FM Broadcast filter, antennas DB 32, 800 mHz, telescoping whip.

Optoelectronics® Micro DTMF Decoder☐
Condition: Excellent. This is a pager size DTMF decoder that can input
the tones through the microphone or line level jack.

All manuals, charger/adapters, etc. included.

These are being sold as a package only.
Price $500 (_firm_) including insured Fedex or UPS one day shipping.

>when I ask if these are the same things as repeater inputs?

Pretty much. The offset is actually a number you add to the repeater
output frequency to get the input frequency. So "offset" is not the
same thing as "input", but knowing either one you can calculate the
other.

For example, our club VHF repeater output is 145.27 MHz. The offset
is -0.6 MHz, so the input is 144.67 MHz.

Dave

Sorry, I can't help you, but I am also looking for the same info.I just bought a pro 74 and was dissapointed at the frequencies that it leaves out. I am now searching for a mod chip to cover these frequencies.....I know they're out there;) Also I am looking for ways to unscramble the frequencies that I can pick up, the ones with all the beeps and chirps. If you find them before me, please let me know at dtisdale@worldshare.net Thanks, Dan

Obviously, you're correct. Of course, the ACS group *I* belong to has a bunch of cops(city/county/and state patrolmen and detectives), firefighters, EMT's, nurses and the occasional public utility guy like me; along with the retired schoolteachers, etc. Kinda blows away THAT theory.

I'd guess that the professionals have chased most of the wannabes away. The city/county/ state guys just keep asking us for more. No black eyes, sometimes a few sore muscles. I guess we no-codes and restructured HF'ers are doing THAT all wrong, too.

"...Fat, lazy,... " Hmmmmm, bunch of us were up "on the mountain" installing a new repeater/link system for most of the infamous "Black Saturday" (April 15, 2000). One of the cops and I were swaying in the breeze above the sight for 6.5 hours, hanging antennae and hardline. Fat, lazy, semiliterate people don't climb with me...but, then again, I became a professional (Land Mobile Radio) long before I became an Amateur.

Hi,
Yeah, those are the inputs to the repeaters. Say like +/- 600 kHz on 2
meters, +/- 5 MHz on 440, etc.

Mine's about 11 years old, going strong. Still has that excellent
audio, and excellent triple-conversion freedom from intermod. I often
wish it were a bit more portable, but as a big heavy desktop scanner,
it works wonderfully.

--Rich

FJB@worldnet.att.net wrote:

For scanning, don't worry about offsets. Simply program the output of the repeater into your scanner. The offset is simply the input frequency to the repeater.

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.swap,rec.radio.scanner

For Sale or Trade:

Uniden SC-150B 100 channel programmable scanner. Instant WX, data lockout, 10-banks. 100% electrical condx. Looks very good, except minor rubbing of lettering. With AC charger/adaptor and manual. $85 + ship.

Also I have a pair of Radio Shack 100 mW 5-channel 49 MHz FM HTs. Working 100%, looks great, but one radio is missing one of the case screws from the back, easily replaced. $35 +ship.

I would prefer to *trade* this stuff as a lot for a 2M mobile or HT (needs to have PL & repeater splits, and 5W at a *minimum*, tone-pad and memories would be nice also) in good working condition.

All Gear working last time tested unless noted. Shipping is extra. Please reply to my email address.
Thanks

Tempo-1: All Tube Ham Transceiver with Power Supply. Covers 80-10 meters. Looks good and works well. $200

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobile power cord and mounting bracket. Looks and works Good. $100

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $45.

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $60.

Marantz Model 2220B: Stereophonic Receiver, with gyro-touch tuning, blue dial and optional real wood case. This unit is in excellent condition, both in looks and operation. I would rate a 9.7. Also have original manual, in excellent condition. $175

AR Inc: Stereo Amp, All solid state. $100. Please don't ask the model #. I have been asked this many times and unable to locate on the name plate. The serial # is: AA002291. It comes with the optinal wood case the face is Gold Alumi. With the following controls: Mode selector, Bass, Treble, balance and volume. In the upper left corner is a red LED and on the bottom right is a normal/monitor switch. I would rate it a 7 on appearance.

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM only. AM not working. $100

Traynor: Group Two B- Audio Amp Head. High/ Low misc. in puts. Master volume,
volume, bass, treble and tone shaper controls. All solid state $125

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) Digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $115 for both.

Bearcat 250 Scanner: Have two. One working at times and one for parts. $50 for both.

RS Pro 30 Scanner: Hand held 16 channel Digital scanner. Looks & Works good, but the battery cover plate is missing $35.

Can anyone tell me how to make an attenuating patch cord? I need to tie my radio into a VOX tape recorder and right now I get a really bad hum. It has been suggested that this may be due to overloading the mic input on the recorder, hence the patch cord....

I know I can get one at RS, but if I can make one....

Thanks

4645. scanner frequencies for Memphis Police Department

Newsgroup: rec.radio.scanner
Date: 2000-06-19 00:00:00 UTC
From: randerson43@my-deja.com
Message-ID: <8ilgoongd1@nnrp1.deja.com>
Source record: 86415

Does anyone have the frequencies for the Memphis Police Department or the Shelby County Sheriffs Department. The frequencies listed in the Bearcat frequency book or the Uniden frequency manual didn't work. I have tried scanning on all banks through the 800's but the only thing that I could find was for Germantown and Bartlett. Robert Anderson

Since it is very hard to fit even 1/8 watt resistors in a 1/8"[3.5mm] jack,
might I suggest that you:
1]get a small metal box. Altoids mint boxes are great.
2]get 2 female 1/8" conectors,
3]get a 10k and a 1k resitor,
4]get another 1/8" to 1/8" patch cable{you can skip the jacks and just
cut your present patch cable in half, but if you do, in 5 minutes you will
need another patch cable for something, trust me I know!!}
Drill 2 holes in the Altoids box to hold the female connectors, even though
you should have a good ground via the connectors, run a wire from each shell
to a common point, scrape and solder to the case.
From the hot[center concuctor on the input connector]run the 10K resistor
to the hot on the out put connector., on the out put connector run a 1k
resistor from its hot to either the shell or the common ground.
You might consisder adding yet another female jack to allow a
speaker/earphones to be used at the same time. Wire the shell to the common
ground, and run a piece of wire from it's hot to the input jack "hot".
Be SURE to LABEL each jack.
For a step up, use the same general case and use a 5k resistor and a 5K pot
[volume control] for an attenuator that you can adjust.
For even more fun, use a transformer to isolate the grounds between the
radio and the recorder. Some groudn loops can only be broekne with this
trick. Get a RatShack[sm] 600:600 telephone matching transformer, wire as
above, ececpt make the output[to recorder] isolated from the case.
Connect one side of the primary to to junction of the 10K and 1K and
the other side of the primary to case ground/junction of the 1K and case.
Connect on side of the secondary to the output hot and the other to the
outpus shell. It really does not make any difference which winding you use
as primary or secondary. And yes there is one heck of a msimatch, but for

recording scanner, sw, non-HiFi, it will work great.
A better solution is to use 10K to 10K transformers, but they are much harder to come by and the ratsahck[sm] telephone jobbers work great!
good luck and I hope this made sense.
I have given up on ascci diagrams. even I can not decypher what I am trying to explain after a week or so.

Strongsignals is the next level, you will find everything there once you get to level two. You are here in level one. Mostly the same old stuff over and over. The mobile uses a different frequency than the base. Each has its own frequency. Confusing because some companies rebroadcast the mobile with the base, so you hear both. The reason you get some in the 900's is because you are getting images of calls that are actually broadcasting in the 800's and your radio is not filtering them out, most likely you have a double filter like most old scanners that get cell, and the double lets a lot of images through. Read a book from the library on amateur radio about how radios work and you will understand how images happen. Also in the low 900's will be cordless phones, which would be your neighbors, if it has very clear sound and no high pitched squeel it is cordless, the same voices at the same frequencies will confirm this; more cordless are at 42 to 50 mhz from the older phones. You get a lot of crap digital noise, not much you can do but change scanners. This can be all kinds of microwaves like computer network to network systems, that will blast out several frequencies in a row. Some like the 2030 are really bad about finding and staying on this loud annoying noise, other scanners like 2032 and 2022 seem to get off the digital in about 5 seconds. Newer scanners like 2040 have a lockout for digital noise, it works most of the time but not always. Course they are newer, scan at 300 per second, and can't get cell.

ok, 464-465 will be security, did you also try searching from 461.0 to
465.0 this will find 462, 463, and 464 mhz frequencies
also try 154.54 and similar VHF frequencies used at events

they may also use wireless microphone frequencies in the 174-215 mhz
range. I have wireless mike freq's in my system at home

He could divide 468 by the freq and cut a vertical to suit eg a 6 foot element
is all he needs he could make a vertical dipole out of wire and hook both
elements onto 75ohm cable and hide it against a wall or inside a stick pipe,
will ok for listening but do not tx on it.

Go to the Rat Shak and get the service manual
and study the power supply section.
You'll see that the manual includes the A and
B models which have the improved memory circuit.
All they did was remove a standard size electrolytic
and replace it with a .5FARAD memory cap.

Invitation to ARRL Field Day

The Schaumburg Amateur Radio Club (SARC) invites Chicago-area hams and all others interested in amateur radio to visit SARC's 2000 Field Day operations in Schaumburg, Illinois, on Saturday and Sunday, June 24 and 25.

Field Day is the most popular amateur radio event in North America. It's purpose is to test the field preparedness and emergency communications abilities of the amateur radio community. Hams throughout the United States and Canada set up portable stations, many in remote locations, using emergency or alternate power, to demonstrate their readiness to provide public service communications under emergency or disaster conditions when public energy and communications infrastructures may be unavailable. In 1999, reports of Field Day operations were submitted by over 2,100 clubs, groups and individuals across the US and Canada, showing participation by over 31,000 individuals. The Field Day operating event is sponsored by the American Radio Relay League (ARRL). ARRL, with over 170,000 members, is the largest amateur radio service and advocacy organization in North America.

SARC will conduct its Field Day operations at the Village of Schaumburg Water Tank, Plum Grove Road north of Golf Road, in Schaumburg, Illinois. Field Day begins at 1:00 PM CDT Saturday June 24th, and concludes at 1:00 PM Sunday. Visitors are welcome, whether or not they are currently licensed amateur radio operators. Visiting a Field Day operation is a great way to learn what amateur radio is all about.

For maps to SARC's Field Day site, visit:
http://www.enteract.com/~ormos/sarc-fdmap1c.gif
http://www.enteract.com/~ormos/sarc-fdmap2c.gif

Hams seeking directions or information may contact us using the SARC repeater (145.23 MHz, -600 kHz offset, 107.2 PL). The repeater will be operating at low power during Field Day.

For information about the Schaumburg Amateur Radio Club, write to us at sarc@ancc.com, call our club information number (847 798 5248), or visit our web site:
http://members.aol.com/sarcradio

For general information about amateur radio, or more information about the American Radio Relay League, visit:

http://www.arrl.org/hamradio.html

I have heard and read about the audio being amazing for its size.
Frankly, I think that my R2 is "tinny"- strong with the high frequency audio signals, and zero bass. Any comments from other R2 owners?

Well, I'm from the HEART of the U.S.A. and am AWFULLY damn proud of it!
Moreover, I lost an Uncle in the 8th AF over Germany. But I think it is worth noting that not only were the Brits there doing it FIRST - by a little more than two years (and most of that ALONE), we were all damn glad to have them as allies. We were in that thing together - without a thought of who would owe whom for what. There have been and will continue to be some differences of opinion, but when the stuff hits the fan there's not a another group I'd rather having minding my six o'clock position! There's a special relationship between our countries and snide little remarks like yours, Mikey-boy, don't do anything but demonstrate your abysmal immaturity and ignorance. The original posting never appeared on my server and the subject line suggests it was pretty damn stupid as well, but your display of bad manners (due, no doubt, to poor toilet training) is inexcusable.

This is a joke, right? The same ICFSC1PC which sold for $99.95 on clearance
less than 2 months ago...and which can now be found new in the box on eBay for
$150-175?

Joey,

Amateur Radio Operators (Hams) enjoy many radio privileges protected by acts of congress and international treaties. Unlike other radio user licenses the group as a whole is very protective and self protecting. If I were using a bootleg (illegal) license it is not the law enforcement guys I would be looking out for. There is a non code exam now for limited frequencies and the only code requirement is now on 5 words per minute.

Why bother risking it with a bootleg license when a real one is so easy.

>
>For scanning, don't worry about offsets. Simply program the output of the
>repeater into your scanner. The offset is simply the input frequency to the
>repeater.
It is very usefull to know the inputs of all the ham repeaters in your
area. A local emergency could knock out all the repeaters and a lot of
hams would operate simplex on the [dead] repeater input.
IT is also usefull to find out the common, and or "offcial" simplex
freqs for your area. There are some general guidelines suggested by
ARRL/RACES/ARES/little green men from mars/whatever that might be usefull.
While I know the "plan" for central Ky, I can not even guess at what
it is in each area.
I find on real good simplex freq to have active in each bank is
146.52. As a ham it has been usefull to hear several aeronautical mobiles
and more than a few souls lost and requesting help.
Each "Band" has a suggested simplex and there are any number of local
"standards".
Good luck

The City of Durham, NC uses a 20-channel Motorola trunked system.

County Fire uses 154.130 (156.7 Hz. tone) for dispatch. County Sheriffs use several channels in the 453 Mhz. range.

I'm not sure of the status of county EMS.

NCHP has a couple of channels on the city trunked system, but also uses low band.

Subscribe to the "Carolinascanner" listserve on eGroups.Com. There's several people on the list from your area who will be glad to help with specific questions for Durham / Durham County, NC.

Do you have a need for an sma-to-bnc antenna adapter that is custom
made to fit and protect your H.T. or scanner radio?

Previewed in the May 2000 Issue of CQ Magazine.

Adapter allows you to:
Quickly change your antennas to base,mobile or different style use.
Use the more popular and wider selection available of bnc antennas.
Prevent chassis connector wear or from coming loose due to always
having to change antennas.

Adapter features:
Gold contacts for best connection.
A low profile design with a rubber covering for a factory antenna look.
The rubber base seals to the top of the radio with no spacers needed
for moisture and dirt protection.
The rubber base also provides an excellent support for all applications.
No need to remove once installed to make any antenna changes.

$11.95 + $1.50 S+H(Sizes to fit most radios)
For complete information and to view a photo of the adapter go to:
WWW.QRZ.COM(SWAP)(ENTER KEYWORD SMA TO SEARCH CLASSIFIEDS)
0R EMAIL: gulyas@netzero.net

I welcome any questions or comments at my email.

>
>Can you give me your opinions on the radio?
>To reply, remove "spamsux" from the email address.

The radio is very sensitive, but the selectivity is poor. Actually, I find this a plus.
Sometimes I use it to quickly search SW and ham bands to see what's hot before
I use other more selective rigs. I also listen to AM broadcast often, and I use a
telescopic
antenna with the rig. My quick summary is that this is an excellent radio for the price, I
use it all
of the time, but it should not be your only scanner or SW receiver.
It works best inconjuction with a regular scanner and shortwave receiver.
I'm also amazed at it's intermod performance, since it has such wide band coverage. I've
compared the
RX to several multiband amateur handi-talkies, and the ham talkies have picked up tv sound
on the
aircraft band while my R2 has been silent. I have had numerous occasions where the HT's
have
overloaded when the R2 has not.
And yes, I think that the R2-06 is the same.

Check out this site: http://www.butel.nl/ if you would like to get schematics for the
receiver, as well as the
computer interface. Even the software.
Also, while you are there in the R2 section, check out STEPHEN G.GULYAS's SMA to BNC shock
absorbing adapter for
the antenna, especially if you want to use a telescopic whip. Stephen is a machinist, and
his product is
excellent.

I bought a new 300 channel scanner from radio shack pro-2050 and I have an nice antenna on the roof. The problem is I get ALOT of static and mixed signals constantly. I have the squelch turned back all the way but it doesnt seem to help. The frequencies in my city seem to bleed over onto the other channels. any suggestions would be appreciated.

There is a gap from 550 - 800 MHz, but all that's there is UHF channels
27-68. BTW it covers the ham band from 1215-1300 MHz too. Excellent
selectivity on this radio, especially 800-1300. I still have mine.

Just wait until you get a look at "Patriot" - a real reworking of
history. A hatchet job on Banestre Tarelton and a shameless fictionalization of
Francis marion Don't get me wrong, it worked out damned well that we "split the
sheet", but there were two sides to the story; and the one we get fed here is
too often based on an exploitation of class envy and downright mythology.

For Sale or Trade:

Uniden SC-150B 100 channel programmable scanner. Instant WX, data lockout, 10-banks. 100% electrical condx. Looks very good, except minor rubbing of lettering. With AC charger/adaptor and manual. $75 + ship.

Also I have a pair of Radio Shack 100 mW 5-channel 49 MHz FM HTs. Working 100%, looks great, but one radio is missing one of the case screws from the back, easily replaced. $25 +ship.

I will sell the above, but would prefer to *trade* this stuff as a lot for an older 2M FM mobile or HT in good working condition.

Yeah, right. The yankkks just watched Ricky Lake and Oprah Winfrey. You're
damned wrong, they'll tell you!

Say, have you seen the TV ad for the Australian Museum? The one advertising
the exhibition about the psychology of colour and how red and orange promote
thinking and memory retention? It's got a trailer underneath and a very fast
voice over. It goes something like this (paraphrase from memory):

"The Australian Museum accepts no responsibility for mental damage arising
out of attending this exhibition and subsequently watching American
talkshows."

Even the Australian Museum is nuking the yankkks -- on TV.

Does anyone know for sure if the PRO-2066 memory is volatile or nonvolatile? I plan to use it in my car and use the cigarette lighter as the power source. The lighter is keyed through the ignition so the scanner will go several days without 12-volt power. Will it keep its memory? Thank you.

While I agree that most comms will be on the output, the last [and only time] the power at the major central ky repeaters went down, there was a lot more traffic on the input then I had expected. Enough to warrent places in one of the "canned" emergency freq lists that I can download into to the Pro2004 and a bank for the PCR1000. And on one repeater that has PL, it has been usefull for those poor out of town sods that do not realise that that repeater is no longer "public".

4763. Win A Pedometer FM Radio

Win a yellow bean shaped Pedometer FM Radio!

Before today I'd never actually heard of one of these, at least the web is good for some things!

This thing can scan all FM Radio Stations depending on what music your ears prefer to hear!

Mad as it may sound it also counts your steps as you walk and this can all be won on http://www.student-net.co.uk by just answering a simple question.

Sent via Deja.com http://www.deja.com/
Before you buy.

I am too tired to go into it all but hands down you should go for the BC 245 XLT.
The computer interface opens up a lot of possibilities with programs like WinScan or Seness's Canadian FREEWARE.

4777. The best freq database there is...

Newsgroup: rec.radio.scanner
Date: 2000-06-22 00:00:00 UTC
From: riradiobuff@aol.comspamsux
Message-ID: <20000622140426.04304.00000082@ng-cs1.aol.com>
Source record: 86265

I've seen lots of people here asking for freq's, well, here's THE source:

http://gullfoss.fcc.gov:8080/cgi-bin/ws.exe/beta/genmen/index.hts

It's a link to the FCC's frequency database. If it's not listed there, it doesn't exist or they're transmitting illegally! :)

I don't think they have federal frequency, but you'll find the frequencies for every town, city, village, state, provience, whatever, in the US on there...

>on the status of my Pro-2004. They want $279 to repair it. I don't
>think so. I guess that's the last time I send anything to them to fix.
>Needless to say, I told them to just send the radio back to me the way
>it was.

I sent a Pro-34 to them, after having to aruge with the sales guy about just getting an estimate. All he knew was how to send it to be repaired. He didn't know what to do just to get an estimate. Anyway, I received the call for the price (they were actually quite fast) and it was $184 to repair (I found a nice ICOM receiver that blows this one away for $179!) so I told them I didn't want it fixed. They said it would take about 3 - 4 days to get back to the store, it took 2 weeks, then the dumb-ass manager tried telling me that they hadn't gotten a written estimate back like I asked. I argued and yelled at him, called him names, called the repair center, called them names, then picked up the scanner and guess what was with it... a written estimate.. hehe

Just gotta love Rat Shack.

AFAIK it was all paid back. Every cent of it, despite the fact that
you didn't require France, Belgium, Holland (and Germany) to pay
back what they might have owed.

He doesn't speak for all of us. We're grateful for the
microprocessor, but I'm not so sure about the operating
system. :o)

That was hardly a Pentium.

On a matter of history, the Americans had broken Japan's 'Purple'
machine well before Pearl Harbour. A feat comparable to breaking
Enigma. Roosevelt knew an attack was imminent from the intercept,
but there was no indication of *where* the attack would be.

Actually, it was:

1) Japanese attack Pearl Harbor Dec 7, 1941
2) US declares war on Japan Dec 8, 1494
3) Hitler declares war on US Dec 11, 1941
4) US "recognizes" Hitler's declaration, Dec 11, 1941

See http://www.historyplace.com/worldwar2/timeline/ww2time.htm#1941

Actually, that is very debatable. Hitler got so paranoid he invaded Russia
(thinking the Brits had done some sort of deal with them) only to have half
his army completely wiped out! Now, the same thing would have occurred
regardless of your belated intervention meaning Hitler would not have had
the resources available to him to mount a (channel) invasion of Britain.
This increasingly respected scenario still leaves the small matter of
liberation to sort out but at least we would still be speaking in our own
native tongue. The truth is quite interesting, that is, of course, if you
American's are interested in the truth. But judging by your countries
recent distortion of history something tells me you are not.

You DEVELOPED the microprocessor in my PC, you did NOT invent it.

When Germany Declared War on the US, in 1941, their U boats were wreaking
havoc amongst US shipping along the eastern seaboard.
The ONLY place you Wanks could launch an attack upon Germany, was from the
UNDEFEATED island of the UK.
You milked us dry and you want us to show gratitude?
How does piss off sound?
You have Military bases and listening posts on our land, where you listen to
OUR phone conversations, You are some piece of work!

SCAN RESUME OFF:
Scan pauses until signal disappears, then resumes 3 sec. after that.

SCAN RESUME ON WITH ADJUSTED DELAY PERIOD:
Scan pauses for the adjusted delay period after receiving a signal, then
resumes. When the received signal disappears, scan resumes approx. 3 sec.
after that. Scan delay can be adjusted from 3~18 sec.

SCAN CANCEL:
Scan is cancelled when a signal is found during scan.

Please be aware that I was using an outdoor base antenna.
I doubt you would have this problem using the R2's antenna
especially at 42-50 MHz. You would probably want all the
sensitivity you can get.

>
> What is the "attenuator" ?

The attenuator is used when a signal is too strong and
overloads the receiver possibly causing distortion or
desensitizing of the receiver. To put it simply you use
it when a signal is too strong for the receiver. It might
be a very close transmitter causing the problem or a very
sensitive receiver.

That seems unlikely, in my experience, when a repeater goes down, everybody
switchs to the repeater OUTPUT and operates simplex.

>snip
> I find on real good simplex freq to have active in each bank is
> 146.52. As a ham it has been usefull to hear several aeronautical mobiles
> and more than a few souls lost and requesting help.

This is a very good idea. Everybody, especially hams, should put 146.52 in
their scanner. I use one bank in each of my scanners for the "emergency"
freqs, 121.5, 243.0, 146.52, 446.00, etc.

DA`s are a pretty slimy breed. Remember , the only way they rise through the ranks is by getting convictions, and some of them do not care what they have to resort to to get them. I have seen them stand right in the courtroom and tell lies about stuff that never happened,. and make other stuff up, just to get that conviction. They are looking to become a judge, become a state prosecutor, etc. And they can only do that with a big "hit" record.

Abuses ? I could go on and on, from the cop up here that molested a 10- year old girl, and didn`t even do 6 months in jail, where he recieved very preferential treatment, a cop that KILLED a teen - ager for a simple traffic violation, and got away scott free fot it, cops that try to shoot their ex-wife`s boyfriend, cops that sell drugs, cops that will railroad you into jail so they can fool around with your wife, and will make up and/or manufacture evidence in order to get it done, with the full cooperation and knowledge of the DA, cops that beat the hell out of and terrorize homosexuals, cops that try to run their wife over with the cruiser, etc,etc,etc,etc,etc, ad nauseum. The job attracts many sick individuals, with a personal agenda, and the system does little or nothing to screen them out or to deal with their offenses, since the system is afraid it will "get a black eye" if it prosecutes and exposes abuses within the system. The system fails to realize that it gets a BIGGER black eye by NOT doing it. If you know an honest, upright individual, that wants to become a cop, and has high moral principles, then I would advise you to talk him out of it, since he won`t last 10 minutes before the "bad apples" coerce him into doing the very things he despises, just to prove he is "one of the guys", and can be "trusted"....
Remember, in a life - threatening situation, the cop must rely on other cops for his very survival, and he is not going to get their cooperation by turning them in for abuses.... The motivation is just not there. In many cases, the DA is equally or even MORE corrupt than the cops I am talking about.
sick, sick, sick, and going to keep on getting sicker...

4847. Re: PRO-2066 Car Power Question

Newsgroup: rec.radio.scanner
Date: 2000-06-23 00:00:00 UTC
From: leadenwah@aol.com
Message-ID: <20000623110138.15668.00000089@ng-ci1.aol.com>
Source record: 86097

The 2066 has non-volatile memory.
RS sold a mobile some years ago, the PRO 2026 I believe, had 2 versions, one had three wires, the orange one was the memory which was volatle. The later version had only 2, red & black and non-volatile memory. The confusion probably comes from that early radio.

4848. Re: Pro-2026 loses memory

Newsgroup: rec.radio.scanner

Source record: 86098

There were 2 versions. The one with three wires was volatile, the orange wire was for memory so that when you started the car you could lose memory.

The second version was non-voltile and had only two power wires, red & black.

Thanks for the info. I plan on using it with a "base" antenna (actually it's just a mobile mag mount, but it works better than a whip) in my basement where my radios are. Otherwise I plan on using the "rubber duck" that comes with it.

Hello,
I live in Newfoundland, Canada and am recieving alot of skip in the 30-50 Mhz. range today. I have identified the source of some. (e.g. police in Connecticut and EMS dispatch in upstate New York)
My question is where is all what sounds like taxi dispatch coming from? It is on many frequencies and is all in foriegn languages. Much sounds Spanish. Are these transmissions coming from the northeast states or is it possibly South American?
Thanks,
David

Dropped by RatShack during lunch, they just had a stack of clearance tags printed out (aprox 50+ items!), among them was a 20-042 on clearance for $9.95 - it looks exactly like the current 20-044 model ($40), picked up the last dusty unit from the back of the storeroom ;-)

Then again iirc it was on clearance a while back?!

fyi,

Peter Khor

TrunkTrac works great (www.scannermaster.com). It allows one to log
data and have alpha tags for talkgroups.

There are 3 versions of TrunkTrac:

5.3 works with many radios like the R7000 and R7100. This requires (and
comes with) an ISA board and discriminator mod on the radio.

6.0 works with the OptoCom and requires no mods at all.

7.0 works with the 245 (and 895 I think) and requires an added cable
(supplied) as well as the regular cable that comes with the radio.

All three versions work the same otherwise, and one can load as many
systems as you want. Only 4 systems at a time can be monitored.

I don't care if you have one 10 channel scanner....your story is what's important.

I remember it all started for me with a Bearcat 200xlt scanner.
I saw it and thought I would loose my mind if I didn't own it!
A week later I traded the guy out of it and another scanner nut was born!

The 20-042 looks nothing like the 20-044.

The 20-042 looks like a large 3-element ground plane antenna.
The 20-044 is a multi-band dipole...Looks sorta like Charlie
Brown's Christmas tree! hehe

Anyway, the 20-042 on sale for $10 is a STEAL! If you don't
mind the large size, it is a great performer. I have called my
local RS stores and there are only 2 in the area. I am getting
one. If your local RS has one, RUN, DON'T WALK to get it!

Merely to set the record straight: Neither Germany noror Japan
ever declared war on anyone. Britain and France declared war on
Germany. The US declared war on Japan and Germany after
Pearl.

And not exactly behind the world's back...it was rather obvious
I would have thought!

Roosevelt went to Congress to get the US into the war against
Japan at any rate, and I'm fairly sure he did the same vis-a-vis
the Germans.

My apologies sir, you were absolutely right. I just went and
bought the 20-042 and it is indeed a multi-band dipole like the
20-044.

I made in incorrect assumption...You know what they say about
ASSUME. "You make an ASS out of U and ME." While I did not
make an ass out of you, I sure did of me.

Anyway, it is a great deal and anyone who is looking for a great
performing outdoor scanner antenna should give it a try.

Here is a quote from the instruction sheet for the 20-042:

"Your antenna has elements which are resonant in the 30-54 MHz,
108-174 MHz, 450-470 MHz, 470-512 MHz, and 800-921 MHz bands.
They work together to give you frequency coverage from 30 MHz to
1300 MHz."

The Radio Shack scanners I've seen tend to have these problems. An attenuator will help. But you might want to consider another radio. Get a refund on the RS and take a look at the Sony ICF SC1 300 CH scanner. The Sony seems to have a much better receiver (although it is harder to program). Check the price of the Sony on Yahoo shopping..

Good Luck

Well, if you've got MS Excell, that'll work just fine. Otherwise, if
there's a specific program that accomplishes what you want easily, I'd be
interested too.

>Is there such a creature?

There were units made that would allow the old Minitor pagers to be used off of DC power with an external speaker and antenna. I forget what the exact name of them were but I'm sure you might find one a John Panick's site or there's even a cat on here who does a once-a-month post regarding what you're looking for. I think the cat's name is Bob Parnass(sp?). Do a Deja search for his name and this NG and you'll probably get something back.

As you may have read, Radio Shack has a base scanner antenna (20-042) on sale for $10. This is a multi-band dipole antenna. Looks sorta like Charlie Brown's Christmas tree.

The feed point of the antenna is 300-ohms. It comes with a 300-75 ohms converter. The idea is to use 75-ohm coax as a feedline. Here is the question:

Could you use 300-ohm twin-lead line to your house and then use the 300-75-ohm converter just before attaching to your scanner? Would the 300-ohm have less loss than RG-6?

Some people just don't get the point. It's a "feature". I don't care if you have a single channel crystal base scanner that you use. If you enjoy the hobby then take a picture of yourself and your equipment do so and send it in with a short story. I'm not looking for the extreme, just some down to earth "Scanner Nuts".

There's alot more to it considering that I have the data port connected to my soundcard and working
and also the audio port being filtered by a realtime DSP program running on my machine that does spectral
display and O-Scope and so on, along with the internal DSP installed.
It isnt the top of all setups and I can't always hear everything but my processing programs allow me to discriminate between static
and a gnat's fart coming from mars.

4882. Uniden BC245XLT

Newsgroup: rec.radio.scanner

I don't know much about Trunk Trackers but can the, Uniden BC235XLT still be operated like a regular scanner? Can you still program in frequencies that are not part of a Trunk radio system, like frequencies in the VHF - 150.100 etc?

Also, how does the scanner working near a computer inference wise?

Thanks

Dave

The Icom does not use the same technology that the Radio Shack PRO-2005/6's used for backlighting...so there's no need to worry about them going dim, or being expensive to replace. It's more of a filament type lamp. It also has adjustable brightness...looks like it would last a long time.

From: jackmndy@frontiernet.net
Message-ID: <3953eecc.1048072@news.frontiernet.net>
Source record: 86136

I just picked this up at a garage sale. It works, but I'm not sure how. There is no way to enter anything. The only buttons select "local police", "state police", "weather", etc. Does this thing scan these respective bands completely? Anyone know exactly what frequendies it covers? I have a feeling I did okay for three bucks.

I found a Regency Informant INF-1 on eBay, but that listing shows a very different radio. With that one, you enter the state abbreviation and it scans appropriate frequencies for that state. The INF-5 has no method of entry at all.

Any info would be appreciated. email: jackmndy@frontiernet.net

yep your right benz i noticed that the 2004 is on his no-no list,though if i was you darrin id e-mail the guy anyways and possibly he could tell you from experience just what might need to be done,he might fix it but without a guarentee,or he might buy it outright for parts. First time ive heard of that design flaw and im assuming they corrected it in the 005-006 series cause my 006 has performed flawlessly after ummm about 10 years,except for having to replace the keypad a couple times-and i got well over 10 mods installed in the thing.
anyways good luck.

Like new in the box. This is an export model unlocked.
Coverage is 30-1300MHz. Just connects to your computer via the serial
port and becomes a powerful trunking and scanning receiver. $425 Shipped

You want the one with the PC port, ICF-SC1PC. This beast is a pain in the ass to program by hand. I got the PC port version a few months ago for $99 with a copy of Percon too!

Yes to the first, and no to the second. Besides, why would you want to run
the (more than likely) chance of picking up any more noise than necessary?

That's really funny. A movie made in Hollywood telling us all that it was a USN force that gained the enigma equipment - it must be true. Sorry to disappoint all the yanks but it was actually a pommy (or is it limeys that you yanks call the English) boarding party from a pommy ship that captured the enigma equipment. Funnily enough the young RN Sub-Lieutenant (equivalent to an ensign in the USN) that lead the boarding was a technical advisor for the movie (shame on him). To bad the yanks couldn't tell the truth and had to make it look like all of their other war movies where the great US of A took on the entire world and won, preserving freedom, the american way and all sorts of other shit. Don't get me wrong I am not putting the US down, they have helped keep peace and have had a large input to making the peace but they certainly didn't do it single handed. Whenever you see a movie irrespective of where it comes from please take it with a grain of salt.

It's probably overloading. You might need an attenuator, or possibly a filter on the antenna line. How does it work with the stock antenna?

The subject of your post lists the BC245XLT, yet in your question, you ask about the BC235XLT. In addition to the answers you've already received, the main differences are the 245 does trunking outside of the 800 MHz band, and can be interfaced to a computer. The 235 can not!!!

This radio works fine but has had an Opto board intalled (now removed and transfered to a 2006) so the battery case is missing. The display is real dim and at it's end but you can still see the frequency. I have no box manual or antenna, just the radio. Yes, it has been clipped for full 800. Yours for $135 shipped CONUS

Source record: 86152

I bought mine when it first came out, used it as a nitelight
for years too, and the display is still good (but I keep it on
"dim" now that I know it may fail someday) and the only
trouble I've had with it is a bad connection on the
attenuator switch on the back. I've read of jumping the
switch to eliminate it from the circuit, but I really didn't
want to pull everything apart to get to it, so holding it in its
proper position, I applied a blob of coax seal to keep it
there, which seems to be working so far (Let's hear it
for low-tech). I hope the radio lasts forever.

Jack:

The Regency Informant INF-5, is a pre-programmed scanner, that did a respectable job of covering the routine frequencies for those generalized bands. What you see, is what you get, and for $3.00 you can't complain! If you don't like it, I'll double your money! :)

Bill Crocker

4944. FS: VHF/UHF Discone & HF/VHF/UHF Super Discones

Newsgroup: rec.radio.scanner
Date: 2000-06-24 00:00:00 UTC
From: antenna_warehouse@my-deja.com
Message-ID: <8j18nb$303$1@nnrp1.deja.com>
Source record: 86155

Hello,

I have both VHF/UHF Discone, and HF/VHF/UHF Super Discone antennas up
on eBay Dutch auctions.

The VHF/UHF Discone are great wide band receive antennas, and are good
for Transmitting in the Amateur 144, 220, 440, 900, and
1290 MHz. bands with a SWR of 1.5 to 1 or less. They are $29.95

This Auction ends 6/25 9:27 pm cst.

The listing is at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=361674180

The Super Discone has additional tunable elements that give this
antenna greatly enhanced performance in the 25-30 MHz. and the
45-50 MHz. bands. They are $45.95

This auction ends 6/25 9:24 pm cst

The listing is at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=361664037

These are being sold in a Dutch auction, which means no worries about
being outbid at the last moment, or the price sky rocketing
because of bidding wars. You bid, you pay, you get one! If you don't
want to go the eBay route, no problem! Just contact me direct.

Be sure to check our other auctions and website for other great deals
on Scanner, CB, and Amateur antennas.

Thank you

They may not have had a decent soccer riot in years but by god do they make
up for it with some decent race riots!!

Yep.....race, religion, freedom and soccer.
All, definitely, causes to die (and kill) for, right ?

Brian WE
Things will get better....when they finish getting worse.

Probably New York City. There are hordes of semi-unregulated taxicabs
running around NYC with unlicensed radios in various bands being operated by
all sorts of immigrant groups.

An article in the paper (LA Times or OC Register, I don't remember which) earlier this month stated that only Irvine and Tustin have switched over so far, and they've been having problems with the new system (transmission failures and such). Motorola send senior technical people to find and fix the problems before any more PDs switched. The schedule for completion of the changeover was stretched out to fall of 2001 as a result. Spokesmen for both PDs were quoted as saying that they expected to have some issues with the new system at first, so they weren't concerned about its reliability after the problems are worked out.

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=365836105

Model#: MBD43UXA7H00AK - Dashmount
56 Channels, & Programmable Zones (Groups)
40 watt output
VHF - 146-174Mhz
Programmable Alphanumeric display for each channel & zone (example "POLICE 1")
LED Lights for Transmit & Busy Channel
CTCSS/DCS/PL/MDC600/MDC1200 capable

Radio Comes With:
Mic & Speaker
Power Plug/Cable
Manual
Antenex 1/4 wave VHF Antenna (Model QW152) & Antenex mini trunk-mount (Model TM8PS) w/PL-259 Connector
RIB Programming Cable worth $65 alone!
I'll also include a copy of the RSS Programming Software for this radio, however I'm unable to get it working on my computer, so it may not be a functional copy. Only included as a possible aid, but no guarantees that it works. (You must have the necessary licenses to use it if it does work.)

This unit is in excellent shape (9 out of 10 cosmetically) and is guaranteed to be in 100% working condition. Selling because it is not needed anymore. I've been told that this package is worth over $800! Reserve price is only $260! Please email with any questions. Good luck, and thanks for looking!

For Sale: Motorola Minitor 1 Charger/Amplifier - NR!!

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=365749636

The Motorola charger is a single-unit battery carger/amplifier for the Motorola Minitor Alert Monitor Receivers which use nickel-cadium batteries. This unit will recharge nickel-cadium batteries either separatly, or while installed in the Minitor Alert Monitor. Two separate charging components permit both spare batteries, and batteries installed in the Minitor to be simultaneously charged. This unit contains a 2.5 watt audio amplifier and speaker, a rectifier and a series-pass voltage regulator in addition to the battery charging circuit. Also the unit has an external antenna input jack to improve area reception.The charger also has slotted holes on the bottom of the unit for wall- mounting. This unit is in excellent shape (9 out of 10 cosmetically). I just purchased it on eBay last week, not realizing it was for a Minitor 1, and I have a Minitor 2. Please email with any questions. Good luck, and thanks for looking!

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=365749636

I have an IC-R7000 communications receiver which is considered by many
to be top of the line.
IC-R7000 specifications:
Frequency range= 25-1000MHz,1025-2000MHz
Frequency control= CPU based digital PLL synthesizer.Direct frequency
entry.
Memories =99 tunable memories store frequency and mode.
Scanning=full scan,programed scan,mode selected scan,selected
scan,memory channel scan,auto write programed scan & priority scan.
Frequency readout=7 digit fluorescent.
Frequency resolution=SSB,FM/AM,owner selectable
100Hz,1KHz,5KHz,10KHz,12.5KHz,25KHz all modes all bands.
Frequency stability==+or- 5ppm @-10c to +60c
Power supply=117 or 240 VAC
Receiving system=25-1000 MHz FM-N/AM/SSB triple conversion,FM double
conversion:1025-2000 MHz,FM-N/AM/SSB quadruple conversion,FM-W triple
conversion.

I will ship to the lower 48 for $700.00

Regards
Bob Stamper

I'm was wondering if anyone out there had an opinion about the DJX10. It seems to be about the only scanner I can find that offers continous coverage (less cell) in the U.S. and costs $350. I can't justify paying much more than that.
Your input is appreciated.

First of all, none of the DC to light scanners is a very good HF
receiver. Some are better than others, the DJ-X10 isn't one of them
however. There are three problems associated with HF operation on
these things.
1). Antenna. The rubber ducky is just about deaf at HF. You need a
much longer antenna. That however is often a blessing in disguise
2). Other than the AR8200 and MVT9000, the AM bandwidthd on HF are
much too wide. IIRC, the DJ-X10 is 12khz. The standard spacing on HF
is 5khz, and the shape factors on these filters isn't all that good
either, so they lack adequate selectivity for good HF operation
3). Image rejection, none of these things has any sort of selectivity
or a tuned front end. They all tend to have serious problems with
image rejection. It isn't until you get up in the R8500 class that you
see tuned front ends with band pass filtering to clean up the image
rejectoin.

ForVHF and UHF these things are find, but if your interest is in HF,
buy an HF receiver. For less than $200 you can get a YB400 or Sony
7600, either of which will beat the daylights out of any DC to light
scanner for less than $1000 for HF use.

4983. Orange Co.(CA) 800 MHz upgrade halted/officer safety at risk

Note: The following news article appeared in today's Los Angeles Times concerning the new Orange County, CA Law Net which is a Motorola Type II digital and encrypted 800 MHz trunked system. Thus far, only the cities of Irvine and Tustin have fully switched over. The article highlights some of the numerous problems those two police departments are having with the new system. The current (old) law system used by the rest of the county is a 460 MHz repeater system that they have been using for about 30 years.

Los Angles Times
Orange County Edition
Saturday, June 24, 2000

O.C. Emergency Radio Upgrade Halted for Bugs

By JACK LEONARD, Times Staff Writer

ï¿½ï¿½ï¿½ï¿½ï¿½Orange County officials have halted expansion of a new $80-million 800 MHz emergency radio system after a series of failures, including one case involving a tense SWAT situation that officers say endangered their lives.
ï¿½ï¿½ï¿½ï¿½ï¿½The much-touted radio system was designed to enhance communication between police and other emergency agencies.
ï¿½ï¿½ï¿½ï¿½ï¿½But police in Irvine, the first city to use it, say the system is riddled with problems that must be fixed before it's expanded to other cities. Tustin is the only other city to go online so far.
ï¿½ï¿½ï¿½ï¿½ï¿½Technicians from Motorola, which is constructing the network, have spent weeks trying to resolve the complaints, but Irvine police say the problems are far from over.
ï¿½ï¿½ï¿½ï¿½ï¿½"We're tired of being the guinea pigs," Irvine Police Sgt. Dave Mihalik said.
ï¿½ï¿½ï¿½ï¿½ï¿½Irvine officers told a county committee overseeing the project that the new radios sometimes fail to pick up calls from dispatchers, produce delayed and garbled messages, drain batteries of motorcycles and cannot penetrate major buildings, such as areas of the Irvine Spectrum complex and underground parking lots. The failures, they said, have led to some tense moments:
ï¿½ï¿½ï¿½ï¿½ï¿½* In one case, a motorcycle officer trying to escape an angry crowd after a concert at Irvine Meadows was unable to start his vehicle because the radio had drained his battery.
ï¿½ï¿½ï¿½ï¿½ï¿½* A garbled communication from an officer responding to a brawl at the Irvine Spectrum prevented colleagues from finding her to help. Officers spent a panicked few minutes running through the complex in a

desperate attempt to find her until she eventually was able to broadcast again over the radio, police said.

ï¿½ï¿½ï¿½ï¿½ï¿½* Earlier this month, officers say, the system delayed communications during crucial moments in the search of an Irvine warehouse for two carjacking suspects. As a result, officers with guns drawn didn't get a message saying that SWAT officers inside were coming out until after they had emerged.

ï¿½ï¿½ï¿½ï¿½ï¿½* In addition, county officials said some wireless phone transmitters are interfering with radio signals from the new emergency network, preventing communication within 100 yards of a transmitter. County officials said there are hundreds of such wireless phone transmitters throughout the county.

ï¿½ï¿½ï¿½ï¿½ï¿½The new 800-megahertz system was designed in the wake of the devastating 1993 Laguna Beach fires, when fire departments were unable to effectively communicate as they fought the blaze. But in a controversy that so far is unique to the steep-sloped beach city, residents demanded that towers for the new system be lowered for aesthetic reasons. Motorola now says it cannot guarantee that the radios will work inside some buildings within the city, because lower towers will increase the chance of blocked signals.

ï¿½ï¿½ï¿½ï¿½ï¿½A Freeze Imposed and Rush Solutions

ï¿½ï¿½ï¿½ï¿½ï¿½Members of the county oversight committee fear that the problems in Irvine and Tustin will spread to other agencies unless they are solved now.

ï¿½ï¿½ï¿½ï¿½ï¿½"We're simply not going to authorize moving forward with those cities until we . . . rectify the problems that we're having," said Allan L. Roeder, chairman of the committee overseeing the radio network and city manager of Costa Mesa.

ï¿½ï¿½ï¿½ï¿½ï¿½Motorola has flown out a team of technicians from Chicago and Florida in an effort to fix the system.

ï¿½ï¿½ï¿½ï¿½ï¿½New radios for motorcycles are being sent out to replace the ones currently being used unsuccessfully in Irvine and Tustin. Meanwhile, company engineers are also trying to recreate the problems with missed calls, garbled messages and other concerns but have met limited success, said company spokeswoman Pat Sturmon.

ï¿½ï¿½ï¿½ï¿½ï¿½Motorola officials plan to meet next week with county officials to draw up a timetable for fixing the difficulties. But company officials were hesitant to say how long they think the delay will last.

ï¿½ï¿½ï¿½ï¿½ï¿½"Motorola wants the officers and the county to have confidence in the radio system," Sturmon said. "We'd like to say that we think that it's going to proceed very quickly because we do feel that a lot of the issues are resolvable."

ï¿½ï¿½ï¿½ï¿½ï¿½Officials once estimated that the county sheriff's and police departments would be using the system by the start of next year. But difficulties in constructing sites to install equipment and other problems will delay completion until at least fall 2001, Sturmon said.

ï¿½ï¿½ï¿½ï¿½ï¿½Sturmon said the company, at its own expense, has altered some of the designs to increase coverage at the Irvine Spectrum. She acknowledged that coverage could be improved further, but at more cost.

ï¿½ï¿½ï¿½ï¿½ï¿½Sturmon stressed that the problems are not the result of fundamental flaws in the company's technology. Once the system is up and running, she said, the new digital technology will enable agencies throughout the county to communicate with each other as never before.
ï¿½ï¿½ï¿½ï¿½ï¿½"You're going to have glitches . . . but the system itself is extremely sound," she said. "It's the fine tuning, while frustrating, that is what will give the officers what they need."
ï¿½ï¿½ï¿½ï¿½ï¿½Roeder agreed but said he was troubled by the inconsistency of the system's performance in the last three months and how long it might take to fix.
ï¿½ï¿½ï¿½ï¿½ï¿½"I do not believe that there is anything fatally flawed with the system," he said. "What concerns me is how long it will take Motorola to accomplish [solutions] and what the risk assessment is to officers and the public in Irvine and Tustin during that period."
ï¿½ï¿½ï¿½ï¿½ï¿½Officers in Irvine have become so frustrated with the system that some use their wireless phones to communicate with dispatchers instead of their new radios, said Sgt. Mihalik, who is president of the Irvine Police Officers Assn.
ï¿½ï¿½ï¿½ï¿½ï¿½"They're unhappy with it, to the point where they get angry . . . because they feel that it's unsafe," Mihalik said. "It's disappointing. To me, the system we had was better than the system we're currently using."
ï¿½ï¿½ï¿½ï¿½ï¿½

Just a reminder to those who purchase this antenna, Jason.

The instructions tell you to use RG-59 coax. Don't! Use RG-6
instead...RG-6 will have less signal loss above 500 MHz.

I've been out of the scanning and SW hobbies for a bit, and could use a refresher course.

I own a RS Pro-43 scanner, and am thinking of upgrading to one of the new trunk tracking models. Does anyone have any suggestions about which is a good buy for this type of coverage? I was really happy with the Pro-43, and would probably lean toward another Radio Shack scanner (understand they're made by Uniden, anyway.)

Any feedback is appreciated!

Marc

Sad but true - although I would put the order slightly differently:
1. Religion
2. Race
3. Soccer

Maybe we should kill off all the religious leaders and the world would be a
happier (and less violent) place. Next knock off all of the racist leaders.
Dunno what we can do about soccer though - maybe we should ban it like all
other fun things!!

From: Webhosting <publishing@net>
Message-ID: <3955385a$0$91264@news2.zeelandnet.nl>
Source record: 86054

Dear scannerfriends,
I was disapointed that the webmaster of the scanner top 50 list has removed more than 50 scannersites which where not in the English language. As I think a scanner top list must include ALL best INTERNATIONAL scannersites, I have opened a International Top 100 scannersite, where everybody who has a scannersite can add his site.
So.......I think the best is ignore that Top50 list and add your site to the new INTERNATIONAL TOP 100 Scanner Sites on
http://www.topsitelists.com/bestsites/pjcarels/topsites.html
Add your site now! A new competition is open. The site will be reset every two weeks and sites who do not add the votebanner will be removed in three days.
I wish you lots of succes !
With kind regards,
Piet.

5001. SMA to BNC to Antenna Adapter

Newsgroup: rec.radio.scanner
Date: 2000-06-25 00:00:00 UTC
From: "Al, N2NKB"
Message-ID: <xCe55.51$NC6.1422@bgtnsc05-news.ops.worldnet.att.net>
Source record: 86057

I performed a stupid act today- sat into a car with my small ICOM R2 radio stuffed into my pocket with a telescopic whip. And sure enough, something had to give.
Fortunately the rig is fine, because I have an adapter that is
flexible, and saved the radio's bulkhead mount. The "rubber shock" adapter sacrificed it's life for the
benefit of the rig. Normally it takes allot of abuse without failing, but then again I went beyond a reasonable
stress.
I ordered two more adapters today, one for a spare, in case I do something stupid
again. The adapters are available through a fellow named Stephen Gulyas gulyas@netzero.net
Stephen is a machinist by trade, and has adapters that support several rigs.
They are not too expensive. About $12 or so.
Although it is not my policy to promote products, if you have an HT that has an SMA connector,
his product may save your rig's connector if you need to adapt to a BNC connector.
Frankly, I feel very uncomfortable with all metal adapters.
Al

Three Versions..... 20-148, 20-148A, 20-148B.
The 148A & 148B models had the 2-wire removable
power cord. The 148 can be converted to the A&B
models by changing the cap I mentioned in my
earlier post. The B version was produced after
May '94 so you should be able to tell the difference
between that and the A model. All this info can be
yours IF you buy the service manual.

Source record: 86069

As you may have read, Radio Shack has a base scanner antenna (20-042) on sale for $10. This is a multi-band dipole antenna. Looks sorta like Charlie Brown's Christmas tree. The feed point of the antenna is 300-ohms. It comes with a 300- 75 ohms converter. The idea is to use 75-ohm coax as a feedline. Here is the question:

Could you use 300-ohm twin-lead line to your house and then use the 300-75-ohm converter just before attaching to your scanner? Would the 300-ohm have less loss than RG-6?

5014. Re: Alinco DJX10

Newsgroup: rec.radio.scanner
Date: 2000-06-25 00:00:00 UTC
From: Gary Sargent <ke8wo@worldnet.att.net>
Message-ID: <39561E94.A15349CF@worldnet.att.net>
Source record: 86070

I've had one for over a year and it is easily my most used receiver and
I also have a Sony 2010, Sony 7600G and Pro2006 scanner. BUT, the
Alinco is not all that comparable to any one of my other receivers in
terms of raw performance. The edge the Alinco has for me is that it has
decent performance, covers everything, and in a very portable package.
I take daily 45 minute walks about my neighborhood and will typically
take the Alinco along .. I start out not knowing what I want to listen
to AM/FM BCB, TV audio, police / fire, HF hams, HF BCB or whatever but I
know the Alinco will cover whatever I choose en-route.

So I suggest the Alinco is a good second receiver to augment a dedicated
shortwave or scanner receiver and when the portability is important.

5019. Reaction tuning:

Newsgroup: rec.radio.scanner
Date: 2000-06-25 00:00:00 UTC
From: "Paul H. Wray" <phwray@cros.net>
Message-ID: <39563177.116CE251@cros.net>
Source record: 86075

Hello:
1). Is anyone out there experienced using the Scout with the AOR8000
reaction tune?
2). Can you scan channels while waiting for a hit?
3). How do you put the "hits" in your memory channels?
I am excited how well the system works.
Please respond directly to phwray@cros.net

Message-ID: <SVx55.1048$482.257018@den-news1.rmi.net>
Source record: 86094

Well, today I was sitting around really bored (that is when I get my strangest ideas). My scanner, which is hooked up to a computer, a 2042 with an optocom 535 board is in my shack, when I am sitting in another room I can hear the scanner, but am not sure which channel it is on, and sometimes with the TV on can't really make out what is being said...sound familiar? Anyways, I have a Dish Network satellite system, the back of the unit has two inputs, one for the satellite dish and one for the off air roof mounted antenna. Since I subscribe to the local channels on the sat system there was nothing plugged into the off air antenna port. I had an old video camera, one of the types that you had to carry around the VCR slung over your shoulder. I hooked up the camera to the antenna input and aimed it at the computer monitor and hooked up an old mike to the audio input and put it in front of the speaker. Now here is the cool part! If I hear something on the scanner, I turn off the satellite receiver with the remote, and the receiver reverts to the off air antenna input and I can both see and hear what the scanner is doing on all the TV's in my house. Is that cool or what! OK, so I'm a full fledged geek, I admit it. Now just need to figure out how to control the computer from another room....IR with a wireless keyboard?...well that is for another boring day.
Gerry

Are you referring to increasing the volume level on the earphone jack? If so, try putting a jumper wire from the grounded side of the antenna's BNC jack, to the grounded side of the earphone jack...that should increase the volume.

Yes, it can do normal and trunked. I keep the different types in
different banks for organizational purposes.

>Also, how does the scanner working near a computer inference wise?

Trunked stuff is easy; normal scanning seems to pick up a load of
interference in my server room.

5053. 10525.00 Mhz Illinois USE????

Newsgroup: rec.radio.scanner
Date: 2000-06-26 00:00:00 UTC
From: terry@weatherford.org
Message-ID: <slg7uko8jev98@corp.supernews.com>
Source record: 85959
Cross-posted to: alt.law-enforcement,alt.radio.scanner,rec.radio.scanner

During frequency searches for Illinois, I keep running into 10525.00 Mhz for lots of different cities.
Some Railroads are also licensed for this. Is this telemetry of teletype or something? Is it still used?

There are 133 licensed in IL to this frequency. They are in the RS radio service.

Some of the call signs are KP2496, KA42382, KA97758, KD5822, KB 52979....

Thanks for any info

HI,
I have a Pro-37 for sale. This radio has not had the mods done but the knowledge to do the mods is ease to gain. This radio is in Good condition. 200 channels, 800mhz, and capable of other freq's.

I am asking $ 100. or your very best offer. Buyer pays shipping from Dallas.

If you have question, would like a pic or just more info please e-mail me cadezigns@juno.com

Thanks
Chris

Are there not efforts to conceal
the towers by decorating or making
them appear as trees, etc.?

There is an issue. People moved
into certain areas based on the
appearance, esthetics, etc. The
city or community planning comes
along - with oft suggestion of some
form of kickbacks - and approves
something that was not originally
planned. It's called "these complex
times."

That's about right for that old a receiver. Parts aren't being made, so
they have to cannibalize others, likely. You are better off to replace it
-- or find some old 2004's and repair it yourself from their pieces.

Got one of those 7.5W powered external speakers for the car from Radio Shack. Model # (210-0541). I'd like to add some type of volume control to it but don't know exactly where to place the potentiometer. Anyone know where the preamp sits in the circuitry on the board? Thanks.

Regards,
Tony

I'm looking for a web site or a freeware program that will return a map marking the position of given latitude/longitude coordinates. I'm trying to pinpoint radio transmitters.

Even so, you probably won't get much of an effort. Unless it's right there in
front of their face, the salesdroid is not going to bother looking for it in
order to get a few cents commission on a $10 sale.

How long before an officer gets hurt or killed because his radio did not operate properly?

When it happens (not IF, but WHEN), I hope his family sues the pants off of the department, Motorola, and whomever else is responsible for feisting these inefficient multi-million dollar radio systems on the taxpayers who not only fund them, but rely on them as well.

Connect it to your VCR and you can record 6 hours of audio for the
really good stuff.You may have to learn juggling all the remotes, though.

Interesting. One of the biggest problems that digital radio systems have is how they deal with Inter-Symbol-Interference (IIS) or "multipath" as it is commonly known. The only thing that works well is a clean path to the radio, though CDMA (spread spectrum) and adaptive coding show promise.

And as we all know, unless you have cell sites inside each building, getting a clean, multipath-free connection everywhere is quite difficult.

It looks like Motorola is demonstrating this very fact at Orange County's expense. Tsk Tsk Tsk...

The bat-wing company should have known better. Even though I hold stock in that company, I feel they deserve to be sued. At least then, they'll learn to pay attention to the technology BEFORE releasing it to the market.

5088. Pro-64/RadioManager Uploading Woes

Newsgroup: rec.radio.scanner
Date: 2000-06-26 00:00:00 UTC
From: BB <sailri@SPAMLESSibm.net>
Message-ID: <3957BA59.DDAC5938@SPAMLESSibm.net>
Source record: 86039

I'm looking for input from the group. I've had a Pro-64 for two years now, and haven't used it as much as I thought I would. I've tried though.

I did try building the PC interface for it, and tried using Radio Manager to upload frequencies, after hours of compiling the 300+ frequencies I wanted in there and inputting them into the Radio Manager Demo.

I decided that this weekend, with the Blue Angels flying overhead for the Quonset Air Show, I would give it another go at it.

It didn't work. After turning on the scanner with the proper keys held down (I believe it was "3" and "enter") I did get the proper prompt on the LCD - "PC".

However after trying the "upload" button in the Radio Manager demo, the "PC" never changed for several minutes, and then gave an error message. My assumption is it timed out looking for a connection.

I've used my serial port for a digital camera, so I know that works and it is turned on.

I guess I can disassemble the homemade interface cable I made following some instructions on one of the Pro-64 sites, and will probably do that next.

A few questions to anyone that knows:

1. Does the Demo version of Radio Manager really support this function?

2. RM says "some functions" won't work after 60 minutes. Is that 60 minutes for that particular session? Is uploading one of the functions?

3. Does anyone have Pro-64 interface instructions that worked for them? It's a pretty simple cable but I could have screwed up.

4. Does anyone use another Pro-64 upload software (shareware initially) that works for them? I'd rather not spend anything for software until I know this all works together. No problem paying for a registered version once it does work, though.

Thanks for any input - I'm pretty down on scanning right now. Especially since one of the instructions in case the uploading didn't work was a reset. So I basically had to enter all the freqs. in Radio Manager, and then manually input them anyway into the scanner, even though they were in there intially.

5089. Pro-64 vs. Sony Wavehawk PC

Newsgroup: rec.radio.scanner
Date: 2000-06-26 00:00:00 UTC
From: BB <sailri@SPAMLESSibm.net>
Message-ID: <3957BC46.5C97E289@SPAMLESSibm.net>
Source record: 86040

You may have read my other post asking for help with trying to get computer uploads to work with the Pro-64. Basically, this was not a good scanning weekend.

In addition to not being able to get the upload capability working, and the resulting re-entering of all 300+ frequencies, I ALSO realized that the whole exercise on Saturday was for naught. I had wanted to listen to the Blue Angels give a performance, and most of the frequencies that I had looked up for them weren't even supported by the Pro-64. Damn!

So, I took a look again at the Sony Wavehawk PC version that's being blown out on the web right now. Sure, it's 2 years old or so, but so's my Pro-64. But it is continuous from 25 Mhz up to 1.3 Ghz except for cellular, so that includes MilAir freqs. It's cheap, at $112. And it comes with a PC interface and software.

Does anyone have both? Which do you prefer to use? Which do you prefer to program, both manually and via PC.

Should I just appreciate my Pro-64 more, or basically replace it for $112? Thanks for any input...

Bill

You may regret not getting it fixed? It would probably cost you $250
for one that's not as in good condition which could go bad soon after
you bought it. At least if you get it fixed... I'll assume that it
would last awhile and Rat Shack gives a 90 day warranty on their
service work. If you don't get $50, I may offer a little less for it.

I believe you are correct.

It may also be that you can listen to those frequencies, but cannot do anything with such information in any way. I've heard it both ways (1- can't listen at all, or 2-can listen, but cannot use the information heard). I'm not sure. Can anyone shed light on this?

Even with losses due to wrong poloarization (TV antenna is horizontal, most scanner stuff is vertical polarized) it might be worth a shot compared to that little duck. If you aren't hooking up to energized wires, you can try most anything as an antenna. Most won't work though.

Glenn

I have the following items for sale. Don't need them any more. Here we go...

1) 1 - 38" Custom made Whelen Edge bar. Includes - front - 2 directional strobes (twist lock relampable), 2 halogen flashers (twist lock relampable), and 2 180 degree end/corner strobes; side - alley's; rear - 180 degree end/corner strobes and 2 halogen flashers. Lo Pro Speaker included. The flasher is "hung up" on steady burn, so it
needs a new flasher, but steady burn actually works very well! ; power supply has less than
5 hours of use, 6 outlet, variable flash, new style Edge power supply. Red, clear, and amber lenses currently on bar. Asking $400 or best offer. Plus shipping.

2) 1 - Whelen Dual Dash Miser; Red/Red, less than 1 year old. Suction cup "Z" style mounting brackets. Asking $100 or best offer. Plus shipping.

3) 1 - Federal Signal compact siren; wail, yelp, manual, & air horn, 100 watts, 2 years old, but still works great. Asking $60 or best offer. Plus shipping.

4) 4 - Whelen 810 series surface mount linear strobe head's. These are the square "box lights" similar to those on an ambulance. Lenses are currently split Clear/Amber. Replacement lenses are around $20. Asking $60 each, or $200 for the lot of 4, or best offer. Plus shipping.

5) 1 - Motorola STX converta-com. Includes wiring harness and palm DTMF / Display mic. Asking $150 or best offer. Plus shipping.

6) 3 - 100 watt siren speaker's. Comes with driver and mounting bracket, 1 or 2 might have the bell and cone also. All are in working condition. Asking $50 each, or $125 for the lot of 3, or best offer. Plus shipping.

7) 1 - Whelen 2 outlet single flash power supply. Not sure on the watts, but the flash is very bright. $30 plus shipping, or best offer.

8) 1 - Whelen WS-295 Siren, less than 2 years old. Special order from Whelen, only does air horn & PA. Can be sent back to Whelen for all tones to be enabled for about
$45. Asking $100 or best offer.

- Motorola Spectra programming cables $45 plus shipping, for low & mid/high power models.

- Motorola Maxtrac / MCS 2000 programming cables $40 plus shipping.

Please E-mail inquiries to JCMEDIC2@AOL.COM

That's a bargain - you ought to get a lot more (you're asking too
much for the MT1000 tho).

Just for curiousity, does it have any engraving on it?

Not familiar with the unit, but the standard operating procedure is as follows....

The wiper, or rotor, of the pot goes to the input of the amplifier. The ccw contact of the stator goes to ground. The input from the source goes to the other half of the stator and the source's ground is attached to the grounded side of the stator, which in turn is common with the amplifier. Find out the input impedance of the powered speaker and select a pot value that is similar to this.

Got it? Good.

MC

We are having the same sort of problems with a digital 468MHz system being introduced to the New South Wales Police Service in Australia. It is also a Motorola system. It's introduction has been stopped while many reception problems are fixed. One police officer here was bashed during a traffic stop because he could not call for assistance. The dispatcher only received some garbled voice signal, and couldn't work out his callsign or location.

So far about AUD$28 million has been spent, and they can't seem to rectify the problems.

Isn't that the same old song and dance. The jerk who uses his cell phone all day long but would scream to holy hell if they put up a cell tower anywhere where he had to see it.

These people are so ignorant. God forbid they would have to endure the pain of looking at a radio tower in their stupid little neighborhood. These are the same people who cry to anyone who will listen when the police don't respond within 30 seconds.

Give me a break!!!

I don't know about that. The local Radio shack store ran a search for me,
as they didn't have one, and found a store in another city 112 miles away
had two. They called the other store, confirmed the availability, and made
arrangements to have it picked up by one of the sales reps and delivered to
the store here, at no extra charge to me. I went in Saturday, and today I
found a message on my answering machine when I got home saying the antenna
was here, $9.97 plus tax.

As the first rply said, "X" band RADAR and automatic door openers.
I can always find a grocery store by X band door opener.
And there a few, I think I "logged" one about 8 years ago, "RASHID" [spelling
is most likley wrong["Anti-collision" RADAR. Very strong, sweeping [not a
a "jammer" wrong sweep rate] at about 10 sec for a 200MHz sweep.
I was testing a X Band ham [right below the police X band] beacon receiver
and this really weird signal came on wiped out the very weak beacon
signal.
I tunned up and had about 30 seconds to "monitor". I had a modified
Bell tronics [as per a '73 magazine artical] radar detector, with the
1+ghz out to a 1-2ghz reciever. It came from a BMW limo studded with antenna.
One of my wierdest "intercepts". I assume that a normal radar detector would
just show it as a police stype CW radar. With this setup I can "hear" a local
door opener over a mile away. But it is impractical for normal "radar
detector" type use because you have to manualy tune the 1-2 ghz receiver.
I like to be able to monitor DC to light.

One other thing to consider is using this CE232/HB232 interface under Windows. Basically the control program is a DOS program, that will run in Windows BUT, if you use a non-standard com port IRQ combination it is lock up city. I finally gave up and went with a newer scanner with the interface built in. A lot less grief in the long run. BTW, I still like my modified Pro-2006 and won't part with it, but the practical side of me won on the interfacing side.

You are right.
I just talked to a friend (retired train engineer) and they use
10.525 for a speedo refference. Very low power aimed at about
45 to 50 degrees.

I have a Pro2004, with a homemade PIC controller to allow an outbord
computer to control it. While it does work and is great for dumping
premade freqencies [I have tried to plan for any normal "emergency"
and have preplanned frequencies that can be loaded], it is a pain
to use. A friend has the CE232 and another friend has the freeware
version whose name escapes me right now. The sad point is, that
while they all work, they are not real windows 95/98 friendly.
and are all a bit of a kluge.
I have 2 PCR1000 and they are much better for computer controlled
scanning and SWL.
And I keep the 2004 because it is very easy to uses even if the
mains are out and I have to reprogram it by hand. Small, compact
adn Human acceasable.
Good luck on what ever choice you make.

>Quote:"WHY IS THAT SO??? NO ONE HAS FOUND OUT OR IS IT BY DESIGN??? I WOULD LIKE TO KNOW
>---THANKS...."
It is by design. Before the scanner "law" of 1994 scanners were "blocked" & the "modification" was really an "UN-modification" to restore the original bands that were designed in & then blocked. New scanners since 1994 aren't allowed (in USA versions) to be simply "blocked" , they don't have cellular display freqs designed into them, so therefore there isn't any (UN)modification available. Just as, for example, 24 to 27Mhz wasn't in most Bearcat & RS scanners, so there was never any "mod" that would put this range into a radio never designed for it.....

Anyone know who this perso is?He is richcom@earthlink.net.His name is:
Richard Schneider from Coolidge Grove New Jersey.The reason I asked.is that
he has just started to be a pain in my rear end.He posted a want for a 286
laptop.I answered and told him I had a 386 and a 486 that work but needed a
power supply for them.I said they were in the garage and I would chrge the
battery for it.I found out that I forgot that there was only one battery
between the two of them.I emailed him to let this be known.I also gave him
both laptops and two new laptop mice for $85.00.He sent a cashiers check as
I will only acept cashiers check,money order or Paypal.Now after I sent out
all this stuff he wants his money back because his wife wants a laptop with
built in mouse.I am now getting threatening emails and he threatens to bad
mouth me on the news groups and auctions.He hasn't got the stuff yet and he
calls it all junk.
Allk I can say is if he wants to buy from you,Ask him if its ok from his
wife or Momma.
Also he has called my wife all kinds of his pet names that he may use on his
wife.He calls us low class trash and a scam artist.
I am not a scam artist as some that I deal with can say.I have to admit that
this is the second jerk that I have had a problem with.Oh Well.At least he
is leaving someone else alone while he shits on me. BEWARE OF RICHARD

5135. Beware of Dick Burke

Newsgroup: rec.radio.scanner
Date: 2000-06-27 00:00:00 UTC
From: richcom@earthlink.net
Message-ID: <395a35fd.13096775@news.earthlink.net>
Source record: 85991

He goes under two emails: n1rsp@qsl.net & toby@gis.net

I replied to a post regarding two laptops. Dick told me they had two batteries and no power cords. He told me they did not have built in mouses but would supply a mouse for one. I said fine for $85. He would only accept Cashier's Check. Everything was his way.

After my cc was in the mail, he emails me the next day, Sunday, telling me, oops, sorry only one battery. But I'm throwing in the mouse. Well, the mouse was already in the original deal. So now for my money I'm only getting one battery where I was purchasing TWO.

Now it's not a deal anymore. So I quickly emailed him back and told him that I did not want the deal anymore and to please send back my cashiers check when it arrived.

To verify it, I phoned him on Monday, because NOW he's ignoring my emails. His wife rudely spoke to me and acted stupid. She didn't know where he was or when she would see him. That was the second hint that I was dealing with unscrupulous people.

What a pair! They deserve each other.

So I phoned again that evening and the phone was busy and still no emails.

The next day, he decides to tell me that my check was immediately deposited and my computers were in the mail. WOW, isn't that something, he takes my money and sends me what he wants, which is a lesser deal than agreed upon.

His emails became very foul and abusive. So I am now dealing with a trashy mouthed person. I'm out the $85 but I hope this is a warning to others before dealing with such garbage.

If anyone wants to see his nasty emails. Let me know, I'll send them to you.

I was a gentleman through the whole deal. Something that he can't say

about himself.

So BEWARE of trashy, crooked, lying DICK BURKE.

The moral of the story is: he misrepresented his items, took the money and ran!

He decided to change the deal and I am stuck with it. Is that fair to

anyone out there? You decide.

Here is an update to all that are interested. The "paperweights" arrived today. Supposedly, Dick charged the one battery before shipping. Well, it held a trickle of a charge just enough to boot up the computer and then DEAD!

I put the battery in the 2nd computer and absolutely NOTHING! No boot, NOTHING! Put same battery back in first computer and again boots up and computer goes DEAD.

By the way, on the 2nd computer, there is a sticker saying "untested" and then in Dick's writing, there is a sticker saying "works". Ummmmmm, have I been taken.

So good ole Dick sent me a battery ok, but he failed to say that the battery can no longer hold a decent charge for more than a few seconds.

Oh well, anyone out there want Dick's good deal? You can have them for the $85 shipped.

What a joke. Enjoy the money Dick. What goes around comes around.

Can't wait till you meet up with someone that is as low and foul as you and your companion.

I have two words for you, " Postal Inspector ". Since you used a postal money order and sent it through the mail, they may be able to help you. If you used the USPS as the shipper, I know they will be VERY interested. A letter from the postal inspector is as welcome as an audit letter from the IRS! Also you may want to contact the attorney general of the state he lives in. They also can be very helpful. Save those E-mails and any correspondence you had with him. Good luck.

73,
Randy.

after going to radio shack and looking for some nice antennaes all i found was a $10 flexible thing. I didnt get cause i dont have any money and it was to small. So i went home and found an old telephone, i ripped it open and took out the copper wire roll (old telphones use rolls of copper wire for some reason, well at least mine did), then i but cut out about 20 (6ft) peices and taped them to my ceiling. Then i ties them all to tohther at one point and stuck that into my scanners antenna slot. Now im getting alot more freqs than i used to with my little rubber stub!!! Huray!

Traveling this fall aboard the QE2. I have all the normal marine channels and short wave frequencies, I'm looking for in house frequencies they might use in connection with the daily operation of the ship if anyone knows or can direct me towards the answer. I have been in contact with user groups in England, so far, nada. :)

Mutt

Hi Les Butler (Saying that cause he reads every post in this Newsgroup)

5148. 860.377mhz?

Newsgroup: rec.radio.scanner
Date: 2000-06-28 00:00:00 UTC
From: Abman <abman@kwetliso.net>
Message-ID: <F1C2806400970999.E36CCB6CCFABAD65.1F258CFC0AD23FF3@lp.airnews.net>
Source record: 85854

My "friend" was scanning thru 800mhz and since his scanner is locked and cant scan cellular it kept on skipping and pick up nothing. But then it hit 860.377 mhz and it picked up a guy dialing. He as a washing machine repair guy and he had reached someone answering machine and he left his number and his name, which was Andy. So my "friend" called that number and got a lady who works at the washing machine repair store, he then asked to speak to Andy but she said he wasnt in, then he asked for his cell phone (assuming that he has one) and she said he doesnt, then she said he has a truck phone. Another incident was when a person was heard saying that he was in his car on his way home and he was talking to his wife, he then said that he cant hear shit on this "truck phone" and that he is gonna hang up.

My friend left this scanner on all night on 860.377 and non stop people were making calls, he never once heard the same person twice. The funny thing is that the person being called was coming thru clearer than the caller, and whenever the caller stopped talking a beeping sound was made, but no beep after the called person finished talking. Another funny thing about it was that when someon dialed a wrong number they got the SW bell lady and not the cellular lady, yet this was a phone without wire.

The following is a re-post of a short disertation on the various laws
and their effect.

The laws of the United States, passed by Congress, are codified as the
United States Code (USC). It is divided into titles covering various subjects.
Title 18 includes the criminal laws and penalties; Title 47 covers
telecommunications. A law can be refered to by its original name (i.e. "The
Communication Act of 1934") or its entry in the USC. A specific section
would be refered to by title/USC/part/section, i.e. 47 USC 605.
To carry out the law, the various government agencies create regulations,
which are codified as the Code of Federal Regulations (CFR). It is likewise
divided into titles, with the FCC's rules in 47 CFR.

18 USC 119 bars the disclosure of any electronic communications to
which you are not a party (with certain legal exceptions), and sets the
penalties. 47 USC 605 (the Communications Act of 1934) also bans the
disclosure or use of third-party communications. With minor changes, this
has been the law for 60 years.

In 1986 Congress passed the Electronic Communications Privacy Act (the
ECPA), which added definitions to the law that banned listening to cellular
telephones. It also banned the monitoring of broadcast auxiliary, SCA and
scrambled signals.

In 1992 Congress passed the Telephone Disclosure and Dispute Resolution
Act (TDDRA), which instructed the FCC to ban the manufacture or import of
scanners capable of receiving cellular. In accordance with this law, the FCC
modified 47 CFR Parts 2 & 15, effective 26 April 1993. Note that this does
not affect the sale of such scanners, so long as they were made or imported

before the cutoff date. It also does not bar individuals from modifying their receivers.

On 25 Oct 94, the Digital Telephony act was signed. Buried in one of the additional sections was a change to 18 USC 2510 & 2511 that added cordless phones to the original ECPA ban on receiving cellular.

In short:
It is illegal to manufacture or import cellular-capable scanners.
It is illegal to listen to cellular (and cordless) transmissions.
It is illegal to divulge any communication to which you are not a party.

Sadly, the post office isn't likely to be much help. My sister got took for a couple grand on an ebay auction from Larry Pizzella WR6K and the post office has done nothing to help.

The California Attorney General asked Larry for his side, and seems to have accepted it, even though the item Larry sold was advertised as "New in Box", and my sister could provide proof from the factory that they'd made two service calls on it.

You were getting an image of the true cell phone freq. The reason it was so clear is it was probably real close to you.

I would guess you were hearing the output of a trunk system repeater.
This system has a freq or 2 for autopatches. Should be on 860.3750...

What the hell are you talking about ?? This sounds like jailhouse
lawyer 'lets try to impress them' bullshit. What you speak of has
no relevance in the context of an ASTRO infrastructure build out.

If you're going to apply CDMA concepts don't you think you should
include Rho, AWGN, code domain power, Eb/No, and other relevant
measurment parameters on the BSI side ?

Motorola ASTRO systems are FDMA ! not CDMA ! to further illustrate
how misinformed your statements are. Error correction is EMBEDDED
into the ASTRO signalling to begin with. Furthermore, when the
signal is repeated (either thru an ASTRO TAC comparator or a
Quantar, or MTR2000 repeater, it is 'refreshed' and restored to
it's original fidelity). On a system where the subscriber unit
is in the fringe area of coverage, the received signal will of
course exhibit certain anamolies manifested has 'weird' spacey
effect type sounds.

ASTRO is C4FM, not say Pi/4 QPSK (ie. TDMA). The figure of
merit is Bit Error Rate (BER), as was in SECURENET systems.

Multipath in a system employing embedded error correction and
proper infrastructure implementation is not an issue.

An 'educated' guess on the Orange County problem is an RSSI
issue. Note that Motorola Engineering warned the county of
coverage issues should the tower heights be lowered to meet
and/or accomodate public opinion polls. This simple act can
make or break a system of this magnitude. Coverage maps are

not constructed haphazardly, Motorola has their own internal
proprietary methods of computing these parameters and the
resultant figures are usually in the system proposal document.
(expressed has a percentage of geographic area in which the
coverage will equal a number, for example 98.99%, based on a
hand held with .35 uv sensitivity, and talk out range equal
to talk in range, etc)....

Voting systems are used to provide this coverage. The paths
to the comparator can be copper or microwave. The performance
of the overall system depends on many factors ranging from
subscriber unit programming, to fixed end infrastructure
issues.

Second guessing the engineers and technicians working on
the project without knowing what you're talking about is
not going to make you many friends.

> It looks like Motorola is demonstrating this very fact at Orange
> County's expense. Tsk Tsk Tsk...

Sounds like you have no clue (or actual hands on experience in
designing, building out, programming, or optimizing) these large
system buildouts. There are numerous fully operational Motorola
ASTRO digital systems in operation throughout the country. They
all work as advertised, if they didn't, do you think they'd still
be selling and closing multi million dollar deals ?

So unless you know what ZAMBI's, DIU's, COIM's, AEI's, or even
Elite CDM's, or what a T3014DX is....save you're opinions and
do more research before you post any comments that are irrelevant
and sounding more like 'techno babble' for the unweary (it might
impress 95% of the readers in this newsgroup, but for those of
us who have to actually build out SmartZone systems and work with
CSC's, RIB's, PLIB's, RNC's, BSC's, and know what say VOC is, etc.
we know better)....

Oh and applying "wireless" concepts to what is inherently a
land mobile system is not going to work. Lucent does not have
anything comparable to an ASTRO TAC comparator ! or for that
matter APCO-25 CAI IMBE subscriber units with Smartnet II
features (ie. dynamic regrouping, or DES encryption on top
of the IMBE vocoded signal).....

Motorola is the leader in this technology for a reason, their
products are cutting edge systems with no commercial equal.

> The bat-wing company should have known better. Even though I hold
> stock in that company, I feel they deserve to be sued. At least then,
> they'll learn to pay attention to the technology BEFORE releasing it
> to the market.

That's what Flashport is for ! and besides, sued for what ?
the county going against the advice of Motorola's engineers ?
(ask Kansas City about that one - all vendors bidding on the
system, especially Motorola objected to changes desired by
the city. Motorola subsequently withdrew from the bidding,
since they saw the fiasco off in the distance). Again issues
about coverage, and serious doubts over meeting them when
changes were made by lay people unfamiliar with the ripple
effects of "minor" revisions.

Ya gotta love the technicalities of the law. By law, if I hear that the police broke up a party down the street from my house on the scanner, and my wife comes home and I tell her that what I heard, I'm technically violating the law... hehe.. that's a good one!

I guess it goes with the golden rule - "It's not illegal if you don't get caught" (at least when dealing with scanner laws...)

Hello,

I have an ICOM IC-R10 that I want to swap for for a nice laptop.

The radio is in very good condition. It is full coverage (no cell block) and comes with two antennas, case, charger and manual. If you don't know the specs on the R10, email me.

The laptop has to have a CD-ROM drive. If it is very nice, I am willing to add a little cash to the deal.

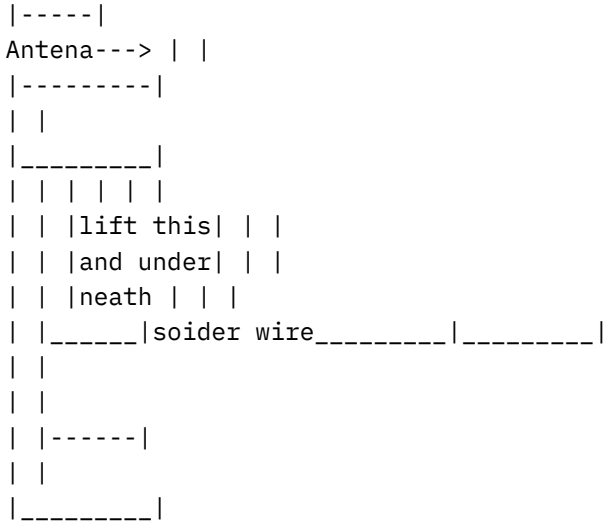
I was browsing some scanner sites and came accross this. Is it really possible? Can it be done with other phones? Tell me what you think.

The file read:

This is designed to help evedrop on celluar phones but not like scanners do, no this designed to be able to jump in on the conversation!
Thats right! You now can intruput those annoying people who never shut up
and say with pride..SHUT THE HELL UP! And the good thing is that you dont
need to be elite to do this, just have a lil brains and time on your hands
and you are on your way to havin great damn fun with stupid lamers.

All you need is a motoral celluar fone (older models from 94-95 are strongly recomended) We got our fones from the flea market, we dont recomended
using your own active fone cause of trace. You can pick up a celluar fone
at the flea market for like 5 bucks! The last thing you need is christmas lights
wire or any other basic copper wire.

Open your fone up and inside is the circut board, remove the intena and soider the copper wire in its place. Here is a diagram below......
(Diagram is distorted)



Here are the steps you must follow for this to work, type these in
1. (req)FNC 00**83786633
2. (req)08# (if you did this right US will pop up)
3.11***# is the channel number, below are some of the numbers of
dif
channels you can use...11 must be put in front of every
channel #

Here are the ones we Discovered

Tx 879.00 Rx 834.00 Chan 0300
Tx 879.99 Rx 834.99 Chan 0333
Tx 881.55 Rx 836.55 Chan 0385
Tx 893.97 Rx 848.97 Chan 0799
Tx 869.04 Rx 824.04 Chan 0800

Channels from motorola bible, we did not make this! it is (C) and we
take no part
in saying that we made this cause we didnt!

(He goes on to list about 1000 channel numbers with the according
freqs, I decided it was to long to post)

4. And to get Audio type 08*
5. And now to the best part...type 10* and you can talk to them!

5.Here are some commands we found out

note
You must have completed steps 1 and 2 before these will work!

1.55* Switch to dif cells (towers)
2.32* Resets Settings to Factory Specs

These are the ones WE made, there is several out there
and if you want more commands come to #phreaking and ask for urls and
txt
files in there, great channel, always down with you.

Sounds like the tempers on both sides are up and burning. Let us not loose the main focus of the subject here. In most of the new trunking systems that are being put in, you can blame both sides for poor performance.

The public safety side for not knowing how to spec and insure they get what they think they are getting. The vender side for delivering what they think they sold to the public safety people.

I have found that in the past, it takes both party's to sit down and try to work out what the each are trying to provide. This sit down is generally leaning towards the vender. This is because the vender understands the equipment much better than the public safety side. The public safety side generally doesn't have the expertise to guide them along.

It may take a third outside party to try to be the referee to try to smooth everything out. Try to bring both together for a solution.

You spent a whole $85 on two laptops and a battery and expected them all
to work? Give it a break.

Hey forget O.C.....
The R.C.S. system in San Diego sounds like crap STILL. There are plenty
of cops in Carlsbad, El Cajon, S.D. Sheriffs,La Mesa and Coronado that
would love to meet a Motorola sales type in a dark alley.

I use Astro Digital in the field (non L.E.).....
Don't go there!

Did you hear quick 1/4 second buzzes every now and then? If so, it was probably receiving a cell phone image, due to intermod, or a true image, etc.

Or did you hear a dial tone in addition to DTMF (touch tones)? If that is so, then you may have been hearing a public safety repeater or such. Some repeater systems have an autopatch allowing employees to make (and sometimes get, if there is a reverse patch) telephone calls.

I want to get a good receiver to grab freqs.
Probably something from OptoElectronics.
I want it fairly small, reliable and can grab
freqs from a distance and hold it in memory.
Long battery life if no charger.
100 KHz - 1 or 2 GHz
Are there any out there that fit the bill?

thanks

He is out here a lot. For some reason he also has an axe to grind with me but
he won't say what for. Maybe it's because he is made at my FraudAlert postings
and he thinks he is on the list or he is going to be put on the list.

If you have had either good or bad experiences out here, please make
the appropriate GoodGuy
or FraudAlert postings on the newsgroup.

Use the word "FraudAlert" in the subject box.

GoodGuy if that is appropriate.

What happens is that all the messages here are posted on www.deja.com.

These postings will be there forever for others to read.

All you have to do is go to "www.deja.com" and do a search using a
number of ways
such as name, callsign, email address or whatever else works.

Anything that has ever been posted about that person on ANY newsgroup
will be there for all to see.

Your postings on the newsgroup will alert others as to whether they
should deal with the seller or not as all postings go to www.deja.com

Sometimes, by posting your "FraudAlert" warning either once a week or whenever
you see the guy out
here, they will make them "come around" and settle with you when they realize
they
will not be able to sell
here or anywhere else for that matter. I have even posted this message with my

ads on the auction sites
just to let others be aware to not screw around.

[One or more binary attachments are retained only in the source text.]

It is not illegal to posses an unblocked scanner as long as the scanner was made before the block took effect. From the way I understand the law, it is illegal to modify a scanner to receive in the cell phone range and it is illegal to listen to the cell phone range on scanners made before the block.

I own a scanner that was made before the ban and can pick up cell phones with it... I just am not allowed to listen to it the way I understand.. can anyone correct me if I'm wrong?

Well Bertone, I don't know where you came from cause I never bought
or sold to you. Your comments are totally unnecessary since you seem
as though you haven't read both sides of the story. There was no
fraud on my part at all.

I was promised TWO batteries and he decides to only have ONE
after my check was mailed and the deal still must go on. Everything
is his way with my money.

THat's fair to you? Wow, how can I be the bad guy. And sure hope
they get here, he's got my wrong address in his posting. Whew, he's
all there......

Then I'm glad I never did buy or sell to you.

Regarding your Fraud list. You probably don't know the two sides to
that story either. You're real fair.

I've bought and sold from alot of great people on the net. 99% are
great people.

Its illegal to listen to ANY phone calls. Cellular or Cordless now. I don't care if you have a scanner made before the new laws. Back in the 80's they came out with a law that said you cannot disclose what you hear.....soon after that they made a new law that states it is illegal to listen to ANY phone conversation.

If you want to listen to Cell phones and cordless, just do it. Do not brag about it to your friends and family. If you want a cell capable scanner order one from Javiation in the UK or some dealer in Canada and do it. These companies are legit and you will get your scanner 99 times out of 100. The chances of US customs catching it are pretty low. They are worried about drugs and terrorist right now and with all the new digital technology out there most of the good conversation are on them. There is still plenty of good stuff to listen on them though. Some people will tell you its boring to listen to them. some will tell you its not right. I say....if the signal is coming through my property and I'm able to pick it up..... well you know the rest.

5190. Introduction to Speech Inversion Scrambling/Descrambling

Newsgroup: rec.radio.scanner
Date: 2000-06-28 00:00:00 UTC
From: ctpds49@aol.com
Message-ID: <20000628082726.04577.00000146@ng-fj1.aol.com>
Source record: 85924

Speech Inversion is accomplished by mixing the speech spectrum
(typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some
audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz
constituting the speech inversion.

Cross-posted to: alt.ham-radio.marketplace,alt.ham-radio.vhf-uhf,rec.radio.swap,rec.radio.scanner,rec.radio.amateur.equipment

I have an IC-R7000 communications receiver which is considered by many
to be top of the line.
IC-R7000 specifications:
Frequency range= 25-1000MHz,1025-2000MHz
Frequency control= CPU based digital PLL synthesizer.Direct frequency
entry.
Memories =99 tunable memories store frequency and mode.
Scanning=full scan,programed scan,mode selected scan,selected
scan,memory channel scan,auto write programed scan & priority scan.
Frequency readout=7 digit fluorescent.
Frequency resolution=SSB,FM/AM,owner selectable
100Hz,1KHz,5KHz,10KHz,12.5KHz,25KHz all modes all bands.
Frequency stability==+or- 5ppm @-10c to +60c
Power supply=117 or 240 VAC
Receiving system=25-1000 MHz FM-N/AM/SSB triple conversion,FM double
conversion:1025-2000 MHz,FM-N/AM/SSB quadruple conversion,FM-W triple
conversion.

I will ship to the lower 48 for $700.00

Regards
Bob Stamper

Source record: 85930

I want an unblocked scanner because of the principle that when I buy a DC to light scanner, I should not have any skips or blocks in frequency
as the whole purpose of me buying an all band, all mode scanner is so that I won't miss a single frequency.
On the other hand, I've listened to Cell conversations on an unblocked scanner before.
It took me a whole 10 minutes to become bored out of my skull and never do it again.

Does anyone know what law covers the reception of cellular and cordless phones? I thought the Telecommunications Act of 1996 created the ban on cell-capable scanners, but I did a search through the whole document and found no references to it. I am also interested in the law that prohibits the monitoring of cordless phones. If this were the case, scanners would most likely be "cordless phone-blocked" as well.

Any links to state laws on these matters would be helpful too.

A place I worked wanted to put up some telephone poles, for testing stuff. The landlord didn't like the idea and wanted them disguised as trees (this is in California). Well., they found some plastic palm tree tops -- but the landlord vetoed them. Seems the plastic palm trees weren't native species.

Aargh.

See USC 2511. Try this link, and search on 'cellular and cordless and prohibited', and you'll get it.

http://uscode.house.gov/

It's possible you have an old copy of the law, cordless was added by amendment to the original law.

First off, if you have the receipt and had the scanner less than a set time, RS policy is, to take it back. Remind 'em of that. Second, no, it' s NOT convertible.

If you bought it used, not from RS, of course, you are stuck with an inexpensive, servicable scanner that can be used for public service reception.

The auction has been over for several days, and the seller pulled the
pictures off his server.

They worked before the auction ended.

Can someone please tell me what form of signalling the LAPD uses? I hear it on TV and it's not like anything I've ever heard, ie: MDC, GEStar, etc.

What is it called and is it specific to the LAPD? Any wav files available anywhere?

Thanks alot!

What were they trying to accomplish?

The 1986 Electronic Communications Privacy Act was passed to help the cellular phone industry. The cell phone people were telling users that the cell phones were as private and a regular phone. Stories on 20/20 and others showed how wrong that was! What to do? Grease the hands of the lawmakers and the ECPA was born!

What were they trying to accomplish? Helping the cell phone industry.

If both systems aren't digital/SST, yes, its possible. I've always been able to turn on the handset with the base on (like you were about to make a call), then unplug the base. There is a chance that the handset will remain on, and you'll hear static (or another conversation if it's on the same analog channel).

Of course, some handsets will shut off, and if there's already a conversation on the channel it was about to connect to, it will switch to a clear one. But you can try.

>course exhibit certain anamolies manifested has 'weird' spacey
>effect type sounds.

FDMA vs. CDMA. Big deal. They both spread. The information theory
isn't all that different. Yes, FDMA can be adaptive and it can help
get around problem interference. But it's still spread spectrum. All
the classic SS information theory still applies.

And then you say "On a system where the subscriber unit is in the
fringe area of coverage, the received signal will... exhibit certain
anamolies [sic]..." --Sounds like you're admitting that it doesn't
degrade gracefully. Gee.

>ASTRO is C4FM, not say Pi/4 QPSK (ie. TDMA). The figure of
>merit is Bit Error Rate (BER), as was in SECURENET systems.
>Multipath in a system employing embedded error correction and
>proper infrastructure implementation is not an issue.

And you accuse me of spouting what? Embedded error correction can be
done in all sorts of ways. How do you know for sure that this system
works in all environments where ISI is a possibility?

And what would you have us believe is "proper infrastructure
implementation" ? Unless you're in the habit of running these systems
from the tops of every tall structure in the whole area, you are going
to get multi-path. Most counties are already in deep hot water
because of all the towers and antennas sprouting off of anything tall
enough to look over the next block.

If this exalted system is going to work, it has to work within those
constraints or it isn't going to happen.

>An 'educated' guess on the Orange County problem is an RSSI
>issue. Note that Motorola Engineering warned the county of

>we know better)....

Anyone can concoct a series of TLAs (Three Letter Acronyms). Use real, fundamental engineering terms and I might concede that YOU know what you're talking about. From your hostile response, I have to wonder.

Actually, I have designed and built a spread spectrum radio as a ham radio operator. We used an STA from the FCC for this experiment. Yes, I do know the math. Yes, I have an electrical engineering degree. No, I don't wear it on my sleeve. Frankly, I'll admit that I don't have a complete grasp of all the specifics. If you want to educate me, however, I'll be happy to oblige.

And by the way, if you're really legit, why not use your real name? I don't hide my real name from anyone.

>Oh and applying "wireless" concepts to what is inherently a
>land mobile system is not going to work. Lucent does not have
>anything comparable to an ASTRO TAC comparator ! or for that

>of the IMBE vocoded signal).....

Yeah. They're waiting for someone else to make the mistakes so they can improve on it. No technology is so cool that it can't be improved on or reproduced in some other functional way.

>Motorola is the leader in this technology for a reason, their
>products are cutting edge systems with no commercial equal.

I know. That's one major reason why I own stock in the company. I'm familiar with many Motorola products. I also know that their field engineering teams often suffer cranial rectal inversions when it comes time to put a product in service. Just ask any technician with a background who has had to "fix" one of these messes. I personally know of more than a few.

>> The bat-wing company should have known better. Even though I hold

>since they saw the fiasco off in the distance). Again issues

>about coverage, and serious doubts over meeting them when
>changes were made by lay people unfamiliar with the ripple
>effects of "minor" revisions.

If they were so good, how did they make this mistake with Orange County?

If Orange County went and changed a bunch of antenna sites from what Motorola bid on, they deserve to get burned. On the other hand, if antenna sites were so critical, Motorola should have written these things in to the contract.

Frankly, I'm skeptical of systems which are so inflexible that they can't withstand a few antenna changes. After all, you can lose a few radio sites to a good lightning storm. If this system can't degrade gracefully from a common thing like that, why on earth is it carrying public safety traffic?

There is one last test that any new engineering feat has to pass: It has to be useful to the user. Believe me, I know. I've designed, installed, and serviced telemetry systems professionally for over 15 years. If that last test can't be passed, then the whole effort at designing a new widget is pointless.

THAT's my point. Now if you want to quibble over why Motorola should or should not be responsible, then make your case. Otherwise, I'll conclude that you're no expert, either.

5231. math problem?

Newsgroup: rec.radio.scanner
Date: 2000-06-29 00:00:00 UTC
From: "G.Singer" <kc0cat@hotmail.com>
Message-ID: <KFO65.2137$482.459695@den-news1.rmi.net>
Source record: 85815

I am working on a remote control project and was hoping someone here could confirm my findings. I'm good at math, but something seems amiss here. If I pretend that the maximum allowed signal strength levels published by the FCC in OET bulletin no. 63 are in english, I wind up with calculated allowable levels of output power in microwatts. My hope is that when radio geeks using standard typewriters get lazy, they start making up shorthand for hams. In some other spots, nomenclature like f/3 means third harmonic rather than freq. divided by 3.

For (125/3) x f(MHz) - (21250/3) microV/m @ 3m
is this supposed to be 11000 microvolts/m for f=433.92 MHz?
That works out (using FCC approx. equation) P=0.3(E squared)
Therefore P = 36.3 microwatts. I'm supposed to be at least P=1 milliWatt
What do you think?
Thanks,
Gerry

Thank God. I'm glad they now have the technology to block these
signals from all of the older scanners (and old TV with UHF Channels
64-83) which would otherwise be able to listen on the unscrambled
signals.

I took a look at your website and yawned. How many radios can you listen to at one time? Do you get your jollies by looking at or stroking/petting all or some?
Whom are you trying to impress because I'm not. It's a boring site, a waste of bytes and therefore I request you scrap it. Thank you.

You're right. Allowable power levels are very low. Actually, they
regulate field strength, but flipping realistic antenna numbers, the
actual power output is indeed in microwatts.

From: Kevin Robokoff <krobokoff@hotmail.com>
Message-ID: <395C1407.EF480869@hotmail.com>
Source record: 85835

I know many old cordless phones come in the low VHF bands particularly
in the 42-48 mhz regions. I wonder if there are still many old phones
out there operating at that frequency or are they the thing in the past
and now all 900 mhz phones??????

5252. Bearcat 9000 question

Newsgroup: rec.radio.scanner
Date: 2000-06-29 00:00:00 UTC
From: Kevin Robokoff <krobokoff@hotmail.com>
Message-ID: <395C14BD.F117A8AD@hotmail.com>
Source record: 85836

I was wondering how the Bearcat 9000 scanner that I own does performance wise against most other scanners that only pick up VHF hi and low, UHF, and AIR???
IS the 9000 supposed to be a very good overall scanner with fairly good sensitivty for the most part all the way across the frequencies it covers???
It seems the FM band is very insensitive and picks up alot of overload from the local tower!!!! Are the TV bands insensitive too and military aircraft bands insensitive???
I also seem to pull in some internal noise at certain intervals on the radio. I did not pull in those noises on my old Cobra 16 channel scanner that covered VHF lo, hi and UHF.

thanks

Kevin

The county had no business in adopting such a unreliable and expensive
radio system. Especially when the tax payers didn't want the big ugly
towers in their neighborhoods. It looks like the county went over
their heads with this digital system. They should have settled for
something smaller, but I guess they wanted the public to be in the
dark. Trunking systems, in general, are unreliable and should be done
away with. Hell, everytime we get a hard rain, the system goes into
the fritz.

A large digital radio system is just plain stupid. They do not work.
I'd like to see what happens to this radio network, if there was ever
a earthquake. It would fail miserably. It would be worth less than the
current radio systems.

Trunking sucks!

Well if the seller said they worked they should work. I would expect the price to be low on outdated computer stuff, but all of my old computers still work as well as ever. They are not for sale cuz they have a market value of ... well .. zero. If I bought a brand new battery for one them then that unit would have a value equal to the new battery. Not very much. If the battery had been in service for a year... well maybe now its down to fifty bucks and still works well.

All of this is very discouraging. I remember before there were all these money grubbers on the net. I was party to several transactions for hundreds of dollars. Every one of them satisfied *ALL* involved. You wouldn't dare to even think about some of those deals, now. I sent a check for several hundred bucks on its way to the owner of a laptop (a new 386) at the same time he sent the machine my way. My check passed his computer enroute. Both of us were happy. I dare you to try that now!

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal
fundamental frequency. Merely supply International with
the exact receiver model number, printed on the rear label,
and the frequency you want to monitor. They will perform
the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second
local oscillator crystal is 11.155 MHz regardless of band.
On VHF high band (148 - 175 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this
formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700
series, one for each local oscillator. The crystal
formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the
first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

last changed June 11, 1998

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://home.cfl.rr.com/scan/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors
Feb 1996 - Radio Shack PRO-2042
Mar 1996 - Tips for Fixing Bearcat Scanners
May 1996 - Compendium of Scanner IFs
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters

Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)
Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable
Oct 1999 - Plectron R700 series monitor receivers
Nov 1999 - Uniden Bearcat BC278CLT clock radio scanner
Dec 1999 - Uniden Bearcat BC248CLT clock radio scanner
Jan 2000 - Radio Shack PRO-92 portable scanner
Jan 2000 - Stridsberg Engineering FLT201A FM Notch Filter and
MCA-204 Receiver Multicoupler
Feb 2000 - Yaesu VR-500 portable wide coverage receiver
Mar 2000 - Uniden Sportcat SC-200 portable scanner
Apr 2000 - Understanding Intermod,
(comparison intermod performance of several models)
May 2000 - Radio Shack PRO-94 portable
Jun 2000 - Radio Shack PRO-2052 trunk tracking base scanner
Jul 2000 - Electra Tiger Scan TSA portable

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO).

Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio,

otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke

sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the

ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier

vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder.

Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see

"The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more

than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has

some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod

immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners

have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they

were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock

out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. For a service manual, call SONY at (800)488- | 7669, and press 3. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal

case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

http://patent.womplex.ibm.com

HAMFEST/COMPUTERFEST CALENDAR 2000 - ILLINOIS
last updated June 16, 2000 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, John Wass KA9QJX, Tom Harker, and ARRL for providing some of the information.

JULY 2000

Jul 8 (Sat): Oak Creek, WI - South Milwaukee ARC. American Legion Post 434, 9327 South Shepard Ave. Admission $5. Talk-in 146.52 MHz. Info, call (414)762-3235.

Jul 9 (Sun): Peotone, IL - Kankakee Area Radio Society, Will County Fairgrounds. I-57 to Peotone exist 327 (East). Free parking. Talk-in 146.94 MHz. http://www.w9az.com. Admission $5. Info: Don Kerouac, K9NR, 6311 East Flora St., Kankakee, IL 60901. Tel: 815-939-7548. Email: k9nr@juno.com

Jul 15 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jul 23 (Sun): Sugar Grove, IL - Fox River Radio League. Waubonsee Community College. Admission $5. http://www.frrl.org/hamfest.html Info: Maurice Schietecatte, W9CEO, 813 Cindy Lane, Sandwich, IL 60548. Tel: 815-786-2860. Email: W9CEQ@arrl.net (good, small to midsized ham- | fest. Easy parking. Modern restroom facilities. - AJ9S)

AUGUST 2000

Aug 12 (Sat): Quincy, IL - Western Illinois ARC. http://www.qsl.net/w9awe. Info: Jim Funk, N9JF, PO Box 3132, Quincy, IL 62305-3132. Tel: 217-336-4191 . Email: jfunk@adams.net

Aug 13 (Sun): Peotone, IL - 66th Annual Hamfesters Hamfest. Will County Fairgrounds. 45 mintues from Downtown Chicago, take I-57 to Peotone Exut 327 (East). 35 acres of free parking. 14,200 square feet of exhibits open at 8 AM. Flea market open at 6 AM to 3 PM. No additional charge for flea

market space. Rain or shine -six covered pavilions for Flea Market. Tickets are $4.00 in advance with double stub, $5.00 at gate with single stub. Children under 12 free. Advance ticket sales and information: SASE and check by July 25th, Christine Mack, PO Box 2161, Oak Park, IL 60303. tel. 708-358-1786, email: christine1@mediaone.net. Talk in on 146.52 simplex and 146.64-(107.2) Stars Repeater

Aug 19 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Aug 27 (Sun): Danville, IL - Vermilion County ARA. Info: Gary Denison, KA9SKS, 14704 East 2750 North Road, Danville, IL 61834-5610. Tel: 217-759-7389 . Email: gdenison@danville.net

Aug 27 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

SEPTEMBER 2000

Sep 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Sep 16 & 17 (Sat & Sun): Peoria, IL - Peoria Area ARC. Info: Ron Morgan, KB9NW, or John Coker, N9FAM, both c/o: PO Box 3508, Peoria, IL 61612-3508. tel: (309)692-3378. Email kb9nw@juno.com or n9fam@juno.com. http://www.peoriasuperfest.com

Sep 23 & 24 (Sat & Sun): Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. http://www.chicagofmclub.org. Admission $8, good both days. Info: Mike Brost, WA9FTS, 5127 North Monterey Avenue, Norridge, IL 60706. Tel: 708-457-0966, Email: mbrost@cin.net (the biggest and best hamfest in northern IL - AJ9S)

Sep 24 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

OCTOBER 2000

Oct 14 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Oct 22 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

NOVEMBER 2000

Nov 5 (Sun): Davenport, IA - Davenport Radio Club. Iowa National Guard Hanger, Mt. Joy Airport. Talk-in 146.88 MHz repeater. http://www.gwltd.com/hamfest

Nov 18 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Nov 18, 19 (Sat, Sun): Ft. Wayne, IN Fort Wayne Hamfest & Computer Expo. Allen County Amateur Radio Technical Society. 2000 Indiana ARRL State Convention. Allen County War Memorial Coliseum Exposition Center. Hours 9 AM - 4 PM EST Sat, 9 AM - 3 PM EST Sun. Admission $5 plus $2 parking. http://www.acarts.com

Nov 26 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

DECEMBER 2000

Dec 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30 AM to 3:00 PM. This show features computers, supplies, games, parts, software, accessories, CD-ROM, monitors, diskettes, printers, keyboards, modems, disk drives, cables,

expansion boards, services, etc. Lake County Fairgrounds,
Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall
Building #1=9720,000 sq. feet. For a show map, exhibitor
info, and discount coupon, visit the web site at
http://www.ccxpo.com.

Quite the opposite my young friend. A democrat is a member of a special interest group that wants more than their 'share' -- money from the government, special favors, special advantage, special anything -- as long as someone else has it, they want it -- it is the 'fair thing' to do.

You really believe all the welfare gathers, foodstamp recepients , homosexuals, and Cigar Smoking presidents are Republicans???? ha ha ha

You'll figure it out as you grow up.

I won't say anything about Lloyd one way or another. As far as having a tech ticket for a long length of time, that is about as long as I've had mine. I haven't transmitted in years either. So what is someone supposed to do, call the FCC and cancel there ticket so they won't be accused of "failure to upgrade'? Why bother, it doesn't eat anything.

Well you see CW....this guy Lllllloooooooyd feels compelled to tell
everyone all about his view of ham radio. How he badmouths higher
class operators, that he doesn't even know. How he supports a known
radio terrorist organazation and then has the audacity to not only come
back to r.r.a.m but to cross post to nearly every other group he is
involved with.

The man is a demented first class fruit cake. His ability in the CW
mode is really un-important. His presence is however. Have you ever
heard the term "Oxygen bandit"?? Thats Lllloooooooooooooooyd.

This is one of the wedge shaped AOR's like the 2002 and 3000. This is a 20 channel radio that covers from 25-550 MHz. This radio is also the same at the Regency 5000 but has all the AOR marking and labels. It is in nice conditon and fully functional,no major scratches or dents and no cracks at all. The display is clear and typically AOR lit with an off switch.

Shipped to your door CONUS via USPS Priority mail with confirmation with power supply and manual for the Regency 5000.

$50.00

Greg Renner

5295. Scanning Legality in New York and Nevada?

Newsgroup: rec.radio.scanner
Date: 2000-06-30 00:00:00 UTC
From: "Paul \"Froggy\" Schneider" <froggy@eecs.cwru.edu>
Message-ID: <8jjndleaf1@eeyore.INS.CWRU.Edu>
Source record: 85722

Hi there,

I am new to the exciting world of scanning! I will be taking my BC 100-XLT on some trips I'm taking this month. The first will be to New York, the second the Las Vegas. After doing some research, I've seen evidence that's it's illegal to possess a scanner within New York state. However, Todd Sherman's page:
http://www.afn.org/~afn09444/scanlaws/
seems to indicate that it's only illegal if you have one in your car. I will
arriving in New York City by train and will not be in a motor vehicle at all for the duration of my trip. Will I be legal by doing so?

Also, I could not find any mention of laws prohibiting the use of scanners in Las Vegas, Nevada. Can someone clarify?

I would appreciate any information and leads you can give me. I want to scan, but I also want to stay legal!

Thanks a lot!

If you respond here, please cc: my email address, too.

Regards,

Paul "Froggy" Schneider

That's just a hard limiter. What about the 4 level slicer?

I see a few problems in the design. One is no bypass caps, which may be omitted for clarity. Another is that a whole op amp is left floating. It could do undefined stuff. Do MDT channels have PL? If that were the case, I'd be inclined to take the other op amp and make a high pass filter to get rid of PL.

BTW, why do people use op amps for comparators? This is probably OK for the application, but from listening to MDTs over the radio, I suspect during the idle periods of the MDT this circuit might toggle it's output as there is no hysteresis in the design.

They probably use the international UHF on-board 25kHz channels :

457.525 ... Marine on-board comms, to 457.575 (may be split +10)
467.525 .. Marine on-board, to 467.575 single, or dual

MegHz

This thread is drifting way OT.
But what the heck!

Morals?
Ethics????
In modern America?
Where the "leader" of the "free world" lies and no one cares.
Where every time any politician speaks you can be fairly certain
it is a lie, or at least less then a usefull representative of
the truth.
Where *.com startups are going to make us all rich.
Where the Social Security trust fund is a bunch of IOUs.
Where the FCC/Congress/Courts declare it illegal to "listen" to
Cell conversations, but where that same government rotuinly
intercepts those same cell calls. The local police department
has at least 5 Pro2004 that where moded to recieve cell, after the ECPA.
Get real.

5306. Re: Beware Dick Burke Part 2..

Well, this is my last bit of waste of breath on DICK! First of all, he better check his medication because there is NO WHERE IN THE NEWSGROUPS that I posted that I was looking for a 286. He is so confused and crooks so many people, he can't keep track of what he's doing.

Oh, NOW, you say you don't know how good the battery is! WOW, again your lied on the phone and in the emails saying the battery was good and you were giving it a good charge.

Both computers do NOT work. One is completely DEAD! With or without the almost dead battery.

You dumped garbage on me. You sold me two paperweights that will eventually just end up in my garbage pail.

As for your mice, keep them! What good are they if the darn computers are trash!

Please, Dick you and your "companion" are definitely waste of human flesh.

Again, this is my last word on this. I'm sure everyone out here is getting as bored and tired of Dick as I am.

Oh, by the way, in case he changes his name, here's his mailing address so you can cross check and make sure you don't deal with this crook.

Dick Burke
Box 1702
Gloucester, MA 01931-1702 (978)281-3359

Oh, I see another mistake I made, PO Box, that should have also given me a clue when he wouldn't give me a street address. Oh well, live and learn. It was a cheap lesson from a couple of cheap individuals.

We have several Relm HS200's for sale. These handhelds were used for NASCAR and are in excellent condition. There may be some very minor signs of use but all were stored in protective casings and used inside a communications van. All are less than 1 year old.
Includes original box, manual, antenna, AC adapter, metal belt clip.
Features PL/CTCSS and DPL/DCS

For picture, specs and more info please see:
http://www.grove-ent.com/USCN8.html

Price is $100 - shipping not included in price.

Please email me with any questions!

John Porter
oceans1@olg.com

5310. computer interference

Newsgroup: rec.radio.scanner
Date: 2000-06-30 00:00:00 UTC
From: David Brock <brockd@home.com>
Message-ID: <lo275.86541$7o1.2102674@news2.rdc1.on.home.com>
Source record: 85757

I have noticed that my computer interferes with my RadioShack scanner a lot and is due to computer interference and makes many of my frequencies on my scanner fussy. This means I have to lock out each fussy frequencies and be listening to other noises that my scanner seems to take in from the computer.

Is there any way to stop or reduce this annoying computer interference ?

I have already tired by moving the scanner further away but it doesn't work and I don't want to resort to an outdoor antenna.

Thanks

Dave

5311. WTD: Windows NT/2000 IIS based interface for PCR-100/1000

Greetings:

Well, most of it is in the Subject line, however, I know of the Linux platform JAVA based program. What I am really looking for is a Windows NT/2000 based program that will allow remote control and interconnection of the Icom PCR-100/1000 radio and the Internet.

All of my current configurations are Windows NT 4.0/2000 Server varieties utilizing IIS 4/5 and I don't want to bring on an additional system just for Linux.

If anyone has any ideas you can post them to this News group, however, please also post them directly to me as well: n3yyp@arrl.net .

Thank you,

Cliff Owen

I agree. But just try explaining that to the general public. The reality is that people are being scared all the time by ignorant journalists who spout all sorts of nonsense on the hazards of RF. The next thing these folks see is that "ugly" tower with a bunch of antennas all set to beam them to death. Never mind the fact that they use PCS phones right next to their heads without a second thought. The tower is evil and it must go.

There is no reasoning on this one. If facts alone aren't enough of an argument, they'll drag out the "aesthetics" issue. And when it comes to a widely held opinion, there is nothing anyone can do or say to counter it.

I wish it were different.

Announcement - *Scancorder* - Free evaluation download

Scancorder - Programmable Sound Recorder with Vox and Timestamping

(Please read all the points - it gets better as it goes along!)

Scancorder is a sound recorder utility which is designed for use by scanning enthusiasts.

With Scancorder you can record and replay audio from your scanner using your computer soundcard. The audio is recorded digitally as a wave file, so that even digital modes can be re-processed or analysed later.

Better
With Scancorder you can program recording to start and stop at predetermined times. You can capture station IDs that occur on the hour, even if you have to be away from your radio receiver.

Better still
With Scancorder you can select Vox operation so that you only record audio when your receiver squelch is open. Even if your radio has no squelch output, Scancorder will detect when a signal arrives. You can leave your scanner monitoring all day long and come back home to hear what has been happening.

Best of all
With Scancorder when you playback a recording, the real datetime that the sound was originally recorded, is displayed on the screen. If you leave Scancorder recording in Vox mode, the time of every transmission or announcement is available.

Requirements

Scancorder runs on a PC under Windows 95/98. To record the audio signal you must have a SoundBlaster-compatible sound card.

You can download Scancorder for free!

www.ip.pt/coaa/scancorder.htm

When you have downloaded the file, unzip it and then run the SETUP.EXE program which will guide you through the installation of the software. Scancorder has an on-line file of helpful hints and tips that will explain all of the features of this useful application.

For more information about Scancorder contact: coaa@mail.telepac.pt

This BC205XLT is identical to the popular BC200XLT. The 205s were sold by Scanner World. Coverage & everything is identical. This one has the full 800 mhz band, so be careful to not listen to those illegal cell calls!

This radio came from Uniden with full cellular. I did not modify it.

I had one of those DX-100's.
It got killed in a lightning storm. :(
I like their 1970's shortwave, the one that did something like 100khz to 30mhz.
It was silver and metal and had a separate speaker that was also silver and metal and matched the receiver.

On the one hand, change is certain as are death and taxes, on the other there is to everyone's benefit a great deal of variety in life. Color B&W, and now digital, stereo mono, and what ever happened to quadrophonic? Oh surround sound of course! We people undoubltedly everyone, prefer this or that, myself included, but to shun one thing for the other is to deny ourselves a well rounded enjoyment of life. I have and use B&W TV as well as color, as well, stereo and mono sound equipment. I do not send or receive morse code to any fruitful degree, but I listen to whatever my radio will pick up. Isn't it a wonderful thing that I can hook up a reader to my radio and let it transcribe the code? Or would it be better to learn how to do it myself? It doesn't matter for I may just learn and in any case I have the choice.

Morals?? you have an opinion on that? It is OK to trash someone on the Internet because they don't pay on an online auction? How do you know he isn't in the hospital, dead, drafted, or killed by a liberal educated street punk? No, it is OK, just to belly whine on the net that you don't get the grubby money that is all important.

You don't know what morality is - it is more than money, you democrat.

Many people have done it without problems, but there is always a risk of it being taken by customs. I have not heard any mention of jail time or fines, just the possibility of losing the radio. I'm sure if you were going to import many of them for resale, you'd be looking at fines and possibly jail.

Okay, Mr. Anonymous -- let's have a race: You build a transceiver from
scratch for your favorite mode, and I'll build a CW transceiver. Let's
see who finishes first and can rack up 1000 QSOs. I'll send you a
soldering iron if you don't already have one. // KH6O

Just pretend they guy never bid and e-mail the next highest bidder and offer the unit to him for his last bid (or you can negotiate another price). You may be able to get out of some of the selling fees by contacting the auction company. I have heard this happens all the time. If you are paranoid, next time you sell, state that you will only sell to people with an established good feedback rating (of some level).

Lines changed since the previous issue are marked with a |
character in the right margin.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Other frequency web sites include:
http://www.fordyce.org/scanning/ and
http://www.scannerway.8m.com.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or

anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the

channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have

the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus

service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120

Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the

scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models

are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801
tel. 714-991-1580

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

G & G Communications
9247 Glenwood Drive
LeRoy, NY 14482.

tel. 716-768-8151

Jan Crystals
Box #-6017
Fort Myers, FL 33911
tel. 941-936-2397

Monitor Crystal Svc
124 W Walnut St Watseka, IL 60970
tel. 815-432-5296

Short product summaries for over 70 scanner models appear in
a separate article, entitled "Scanner Radio Review Briefs."
You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229, email: electra@tcon.net,

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Hey I have a question, I am getting my Icom pc100 tomarow but I am wanting to know (even for regular scanner, is there a program that I can use on my computer that can record the scanner ONLY WHEN TALKING like voice activated.

this type of feature (program) would be awsome so that when I am out with my search and resucue unit I can record the radio trafic for ttraining purpose. jbut I dont want to set something on straight record that would make the file way to big.

any idea's or suggestions?
thanks

What you hear is an old Motorola signalling protocol called Modat. It's less efficient than MDC but LAPD perfers it for some reason. It's only available (as far as I know) in the digital (Astro) radios. To the ear this protocol sounds much different than MDC and other modern signalling techniques. I uderstand the data rate is much slower than others.

Cuz in the cold cool light in the morning, the realize they have been taken?? (by themselves, which is harder to take, of course). That's why you sell on ebay isn't it? knowing you will get a lot more for crap than it is worth at any other market? Take a hit now and then like a man, in the long run you'll still be richer.

Hmmmm. I hope that something was funny. The coment about
Astro Digital systems in operation throughout the
country, working as advertised, was right on the money.

I deal with two of them daily. Very few problems.

And I suppose that since it's illegal to monitor phones, no one does it.

And no one speeds because it's illegal.

I personally get bored of listening to phones. The only interesting stuff I ever heard was one guy telling someone that he bought a stolen Ford Explorer, Eddie Bower Edition, from a car dealer who told him it was stolen. If I had heard what car dealer it was I would have given the local police a "tip"...

>heard a possible rumor that they might move to 800Mhz.
>

They're still in the 150's operating simplex but I've heard them refer to a
repeater from time to time.. that could possibly be 800mhz. They could
definately benefit from a repeater system...

Go to the FCC's frequency data base at
http://gullfoss.fcc.gov:8080/cgi-bin/ws.exe/beta/genmen/index.hts and see what
you can find for RISP freq's...
